

# Mathematics, Modeling and Data Analytics

**Bachelor of Science** 

# Subject-specific Examination Regulations for Mathematics, Modeling and Data Analytics (Fachspezifische Prüfungsordnung)

The subject-specific examination regulations for Mathematics, Modeling and Data Analytics are defined by this program handbook and are valid only in combination with the General Examination Regulations for Undergraduate degree programs (General Examination Regulations = Rahmenprüfungsordnung). This handbook also contains the program-specific Study and Examination Plan (Chapter 6).

Upon graduation, students in this program will receive a Bachelor of Science (BSc) degree with a scope of 180 ECTS (for specifics see Chapter 4 of this handbook).

Version	Valid as of	Decision	Details
Fall 2023-V1.3		Sep, 18, 2023	Editorial changes in the study and scheme plan
Fall 2023-V1.2		Aug 02, 2023	Editorial changes in all study schemes
Fall 2023.V1.1		May 26, 2023	Editorial changes in all handbooks
Fall 2023 – V1	Sep 01, 2023	Apr 26, 2023	Substantial change approved by the Academic Senate
		June 26, 2019	Originally approved by Academic Senate

#### 1.1 Concept

#### 1.1.1 The Constructor University Educational Concept

Constructor University aims to educate students for both an academic and a professional career by emphasizing three core objectives: academic excellence, personal development, and employability to succeed in the working world. Constructor University offers excellent research driven education experience across disciplines to prepare students for graduate education as well as career success by combining disciplinary depth and interdisciplinary breadth with supplemental skills education and extra-curricular elements. Through a multi-disciplinary, holistic approach and exposure to cutting-edge technologies and challenges, Constructor University develops and enables the academic excellence, intellectual competences, societal engagement, professional and scientific skills of tomorrows leaders for a sustainable and peaceful future.

In this context, it is Constructor University's aim to educate talented young people from all over the world, regardless of nationality, religion, and material circumstances, to become citizens of the world who are able to take responsible roles for the democratic, peaceful, and sustainable development of the societies in which they live. This is achieved through a high-quality teaching as well as manageable study loads and supportive study conditions. Study programs and related study abroad programs convey academic knowledge as well as the ability to interact positively with other individuals and groups in culturally diverse environments. The ability to succeed in the working world is a core objective for all study programs at Constructor University, both in terms of actual disciplinary subject matter and also to the social skills and intercultural competence. Study-program-specific modules and additional specializations provide the necessary depth, interdisciplinary offerings provide breadth while the university-wide general foundation and methods modules, optional German language and Humanities modules, and an extended internship period strengthen the employability of students. The concept of living and learning together on an international campus with many cultural and social activities supplements students' education. In addition, Constructor University offers professional advising and counseling.

Constructor University's educational concept is highly regarded both nationally and internationally. While the university has consistently achieved top marks over the last decade in Germany's most comprehensive and detailed university ranking by the Center for Higher Education (CHE), it has also been listed by the renowned Times Higher Education (THE) magazine as one of the top 300 universities worldwide (ranking group 251-300) in 2019 as well as in 2021. Since 2022 Constructor University is considered to be among the top 30 percent out of more than 1600 universities worldwide and is ranked the most international university in Germany. The THE ranking is considered as one of the most widely observed university rankings. It is based on five major indicators: research, teaching, research impact, international orientation, and the volume of research income from industry.

#### 1.1.2 Program Concept

Mathematics is at the foundation of science, ranging from the beauty of theory and pure thought to applications in almost all areas of the natural sciences, engineering, economics, finance, and even the social sciences. While Mathematics is an ancient subject, and its applications also date back to many

centuries, recent advances of the last two decades in Data Science have revolutionzed all these applications as well as some areas of mathematics itself.

As such, a bachelor's degree in Mathematics, Modeling and Data Analytics offers a unique combination of intellectual breadth and disciplinary depth. Specifically,

- Mathematics, Modeling and Data Analytics offers a great variety of academic career paths, ranging from teaching at all levels to research in mathematics and its adjacent fields, as well as all careers where Data analytics is valuable.
- a bachelor's degree in Mathematics, Modeling and Data Analytics qualifies students for graduate study not only in Mathematics, but also in neighboring disciplines such as Engineering, Physics, Data Science, Economics, Finance, MBA programs, and many others;
- Mathematical thinking combined with modeling and programming skills is the key to employment in a variety of high-level strategic positions in which analytic thinking, problem solving, and quantitative skills are paramount, ranging from consultancy, public administration, information technology, and data security, to high-level management.

In surveys, mathematicians consistently report strong personal identification with their field in combination with a high level of job satisfaction.

# **1.2** Specific Advantages of Mathematics, Modeling and Data Analytics at Constructor University

The key element in our education is that we do not simply teach courses to students but accompany them as individuals throughout their education and help them identify, or even achieve, their personal goals. In this spirit, the Bachelor Program in Mathematics, Modeling and Data Analytics at Constructor University offers

- a three-year program with advanced study options providing optimal preparation for graduate education at top European and US universities,
- a flexible curriculum which adapts to student interests and pace a flexible choice of a minor subject,
- small classes and close faculty-student interaction,
- personal mentoring and advising,
- options for early involvement in research,
- vibrant international community of motivated and gifted peers.

A key advantage of this interdisciplinary program is that it equips students both with mathematical tools for formulating and analyzing problems as well as context provided in modeling real-world problems and algorithmic data-driven approaches towards solving them. The strong mathematical foundation sought for in the program equips students with more powerful methods of analysis and modeling problems serves as a wide source of mathematical questions.

# 1.3 Program-Specific Educational Aims

# 1.3.1 Qualification Aims

The program aims at a broad general education in mathematical and modeling skills, where a high level of mathematical thinking and modeling skills is brought to bear on dealing with many challenging problems emerging from contemporary applied contexts. The program is designed with the goal in

mind that its graduates are optimally qualified to continue graduate education in pure or applied mathematics or in a variety of fields of application. At the same time, the program aims at developing key transferable skills for a future professional career, either indirectly via a graduate degree or by direct entry into the work force with a bachelor's degree in Mathematics, Modeling and Data Analytics.

The detailed overarching program aims are

- comprehensive basic education in the core fields of pure and applied mathematics;
- Comprehensive skills in solving mathematical modeling problems and their implementation
- Basic education in data analytics and its application to modeling problems;
- optionally teach the core principles of scientific computing and/or financial mathematics;
- provide the option to achieve additional depth in the core areas of mathematics via a
- lead students into taking responsibility for themselves, for others, and for society at large, and to responding constructively and effectively to new and important challenges.

# 1.3.2 Intended Learning Outcomes

By the end of the program, students will possess a wide range of skills in Mathematics, Modeling and Data Analytics. They will be able to

- 1. make rigorous mathematical arguments and understand the concept of mathematical proof;
- 2. recognize patterns and discover underlying principles;
- 3. confidently apply the methods in the core fields of pure and applied mathematics (Analysis, Linear Algebra, Numerical Analysis, Probability, Topology, Geometry) at a level allowing easy transition into top graduate schools around the world;
- 4. Create mathematical models for a wide range of real-world problems;
- 5. Perform statistical analysis, machine learning algorithms, and visualize data;
- 6. Solve mathematical problems, independently analyze mathematical proofs, and present them coherently;
- 7. understand and be able to apply the key concepts in two or more of the following, at the level of a first advanced undergraduate course: Complex Analysis, Algebra, Ordinary Differential Equations, Number Theory, Stochastic Processes, Dynamical Systems and Discrete Mathematics.

Graduates possess the following Practical Skills:

- 8. the ability to write programs in at least one programming language;
- 9. Knowledge in mathematical modeling and their application to everyday problems;
- 10. Ability to formulate mathematical ideas in written text;
- 11. Ability to present mathematical ideas to others.
- Further, graduates possess the following Transferable Skills. They are able to
  - 12. think analytically;
  - 13. present complex ideas to specialists and non-specialists;

- 14. are confident in acquiring, understanding, and organizing information;
- 15. possess generic problem-solving skills, including a sense of determining what is already known, what is not known, and what is required to obtain a solution;
- 16. demonstrate a sense for the use of Mathematics in one or more fields of application.

Finally, graduates possess the following Subject-independent Skills. They are able to

- 17. engage ethically with academic and professional communities, and with the general public to actively contribute to a sustainable future, reflecting and respecting different views;
- 18. take responsibility for their own learning, personal and professional development and role in society, evaluating critical feedback and self-analysis;
- 19. take on responsibility in a diverse team;
- 20. adhere to and defend ethical, scientific and professional standards.

# 1.4 Career Options

A degree in Mathematics, Modeling and Data Analytics opens the door for a wide range of career options. These include:

- Insurance companies hire mathematicians in actuarial and other analyst positions.
- Quantitative Finance and Financial Engineering offers numerous opportunities involving fairly deep mathematical concepts.
- Operations Researchers help organizations, businesses, and government find efficient solutions to organizational and strategic planning questions, including scheduling and distribution problems, resource allocation, facilities design, and forecasting.
- Mathematicians are frequently employed in Information Technology positions. In particular, mathematical knowledge is essential for work in information security and cryptography.
- Statisticians are employed by large organizations and work in research and development divisions from academia to industry to analyze data from surveys and experiments.
- Education offers a wide field of employment ranging from secondary school teachers to university professors.
- There are job opportunities in Engineering Mathematics in sectors from aerospace engineering and petroleum engineering to a wide range of other engineering disciplines.
- Last, but not least, mathematicians pursue academic careers at research institutes or universities.

The Career Service Center (CSC) helps students in their career development. It provides students with high-quality training and coaching in CV creation, cover letter formulation, interview preparation, effective presenting, business etiquette, and employer research as well as in many other aspects, thus helping students identify and follow up on rewarding careers after graduating from Constructor University. Furthermore, the Alumni Office helps students establish a long-lasting and worldwide network which provides support when exploring job options in academia, industry, and elsewhere.

# **1.5** Admission Requirements

Admission to Constructor University is selective and based on a candidate's school and/or university achievements, recommendations, self-presentation, and performance on required standardized tests. Students admitted to Constructor University demonstrate exceptional academic achievements, intellectual creativity, and the desire and motivation to make a difference in the world.

The following documents need to be submitted with the application:

- Recommendation Letter (optional)
- Official or certified copies of high school/university transcripts
- Educational History Form
- Standardized test results (SAT/ACT) if applicable
- Motivation statement
- ZeeMee electronic resume (optional)
- Language proficiency test results (TOEFL Score: 90, IELTS: Level 6.5 or equivalent)

Formal admission requirements are subject to higher education law and are outlined in the Admission and Enrollment Policy of Constructor University.

For more detailed information about the admission visit: https://constructor.university/admission-aid/application-information-undergraduate

# **1.6 More information and Contacts**

For more information on the study program please contact the Study Program Coordinator:

Dr. Keivan Mallahi-Karai

University Lecturer of Mathematics

Email: kmallahikarai@constructor.university

or visit our program website: <u>https://constructor.university/programs/undergraduate-</u> education/mathematics-modeling-data-analytics

For more information on Student Services please visit:

Student services | Constructor University

#### 2 The Curricular Structure

#### 2.1 General

The curricular structure provides multiple elements for enhancing employability, interdisciplinarity, and internationality. The unique CONSTRUCTOR Track, offered across all undergraduate study programs, provides comprehensive tailor-made modules designed to achieve and foster career competency. Additionally, a mandatory internship of at least two months after the second year of study and the possibility to study abroad for one semester give students the opportunity to gain insight into the professional world, apply their intercultural competences and reflect on their roles and ambitions for employment and in a globalized society.

All undergraduate programs at Constructor University are based on a coherently modularized structure, which provides students with an extensive and flexible choice of study plans to meet the educational aims of their major and complete their studies within the regular period.

The framework policies and procedures regulating undergraduate study programs at Constructor University can be found on the website (<u>https://constructor.university/student-life/student-services/university-policies</u>).

#### 2.2 The Constructor University 4C Model

Constructor University offers study programs that comply with the regulations of the European Higher Education Area. All study programs are structured according to the European Credit Transfer System (ECTS), which facilitates credit transfer between academic institutions. The three-year undergraduate program involves six semesters of study with a total of 180 ECTS credit points (CP). The undergraduate curricular structure follows an innovative and student-centered modularization scheme - the 4C-Model.It groups the disciplinary content of the study program in three overarching themes, CHOICE-CORE-CAREER according to the year of study, while the university-wide CONSTRUCTOR Track is dedicated to multidisciplinary content, methods as well as intellectual skills and is integrated across all three years of study. The default module size is 5 CP, with smaller 2.5 CP modules being possible as justified exceptions, e.g., if the learning goals are more suitable for 2.5 CP and the overall student workload is balanced.

Figure 1: The Constructor University 4C-Model

# 2.2.1 Year 1 – CHOICE

The first study year is characterized by a university-specific offering of disciplinary education that builds on and expands upon the students' entrance qualifications. Students select introductory modules for a total of 45 CP from the CHOICE area of a variety of study programs, of which 15-45 CP will belong to their intended major. A unique feature of our curricular structure allows students to select their major freely upon entering Constructor University. The team of Academic Advising Services offers curriculum counseling to all Bachelor students independently of their major, while Academic Advisors, in their capacity as contact persons from the faculty, support students in deciding on their major study program.To pursue an MMDA major, the following CHOICE modules (30 CP) need to be taken as mandatory modules during the first year of study:

- CHOICE Module: Analysis (m, 7.5 CP)
- CHOICE Module: Programming in Python and C++ (m, 7.5 CP)
- CHOICE Module: Linear Algebra (m, 7.5 CP)
- CHOICE Module: Mathematical Modelling (m, 7.5 CP)

Students can choose between the following two mandatory elective CHOICE modules in the second semester:

- CHOICE Module: Core Algorithms and Data Structures (me, 7.5 CP) or
- CHOICE Module: Algorithms and Data Structures (me, 7.5 CP)

The remaining CHOICE module (7.5 CP) can be selected in the first semester of study according to interest and/or with the aim of allowing a change of major (see 2.2.1.1 below).

Analysis and Linear Algebra cover the foundations of the areas of calculus and linear algebra from a rigorous mathematical perspective. In addition, the modules Mathematical Modelling and either the CHOICE modules Core Algorithms and Data Structures or Algorithms and Data Structures provide the foundation for mathematical modeling and basic programming skills. These CHOICE modules are complemented by the Methods modules (Matrix Algebra and Advanced Calculus I + II) which equip students with complementary skills in calculus and linear algebra, see Section 2.2.4.1.

Students can still change to another major at the beginning of their second year of studies, provided they have taken the corresponding mandatory CHOICE modules in their first year of studies. All students must participate in an entry advising session with their Academic Advisors to learn about their major change options and consult their Academic Advisor prior to changing their major.

To allow further major changes after the first semester the students are strongly recommended to register for the CHOICE modules of one of the following study programs:

- Physics and Data Science (PHDS)
   CHOICE Module: Classical Physics (m, 7.5 CP)
   CHOICE Module: Programming in Python and C++ (m, 7.5 CP)
   CHOICE Module: Modern Physics (m, 7.5 CP)
   CHOICE Module: Mathematical Modeling (m, 7.5 CP)
- International Relations: Politics and History (IRPH) CHOICE Module: Introduction to International Relations Theory (m, 7.5 CP)

CHOICE Module: Introduction to Modern European History (m, 7.5 CP)

- Integrated Social and Cognitive Psychology (ISCP)
   CHOICE Module: Essentials of Cognitive Psychology (m, 7.5 CP)
   CHOICE Module: Essentials of Social Psychology (m, 7.5 CP)
- Computer Sciene (CS)
   CHOICE Module: Programming in C and C++ (m, 7.5 CP)
   CHOICE Module: Algorithms and Data Structures (m, 7.5 CP)
   CHOICE Module: Introduction to Computer Science (m, 7.5 CP)
   CHOICE Module: Introduction to Robotics and Intelligent Systems (m, 7.5 CP)

# 2.2.2 Year 2 – CORE

In their second year, students take a total of 45 CP from a selection of in-depth, discipline-specific CORE modules. Building on the introductory CHOICE modules and applying the methods acquired so far (see 2.3.1), these modules aim to expand the students' critical understanding of the key theories, principles, and methods in their major for the current state of knowledge and best practice.

To pursue Mathematics, Modeling and Data Analytics as a major, 40 CP mandatory CORE modules need to be acquired:

- CORE Module: Algebra (m, 5 CP)
- CORE Module: Complex Analysis (m, 5 CP)
- CORE Module: Real Analysis (m, 5 CP)
- CORE Module: Number Theory (m, 5 CP)
- CORE Module: Discrete Mathematics (m, 5 CP)
- CORE Module: Computational Modeling (m, 5 CP)
- CORE Module: Machine Learning (m, 5 CP)
- CORE Module: Scientific Data Analysis (m, 5 CP)

Students complement their studies by taking 5 ECTS of the second/third year Specialization modules (please also see 2.2.3.2):

- MMDA Specialization: Topology and Differential Geometry (me, 5 CP)
- MMDA Specialization: Foundations of Mathematical Physics (me, 5 CP)
- MMDA Specialization: Stochastic Modeling and Financial Mathematics (me, 5 CP)
- MMDA Specialization: Dynamical Systems (me, 5 CP)
- MMDA Specialization: Stochastic Processes (me, 5 CP)

# 2.2.2.1 Minor Option

Mathematics, Modeling and Data Analytics do not have the option of taking a minor as the study program already combines different disciplines.

# 2.2.3 Year 3 – CAREER

During their third year, students prepare and make decisions for their career after graduation. To explore available choices, and to gain professional experience, students take a mandatory summer internship. The third year of studies allows Mathematics, Modeling and Data Analytics students to take specialization modules within their discipline, but also focuses on the responsibility of students beyond their discipline (see CONSTRUCTOR Track).

The 5th semester also opens a mobility window for ample study abroad options. Finally, the 6th semester is dedicated to fostering the research experience of students by involving them in an extended Bachelor thesis project.

# 2.2.3.1 Internship / Start-up and Career Skills Module

As a core element of Constructor University's employability approach, students must engage in a mandatory two-month internship of 15 CP that will usually be completed during the summer between the second and third years of study. This gives students the opportunity to gain first-hand practical experience in a professional environment, apply their knowledge and understanding in a professional context, reflect on the relevance of their major to employment and society, reflect on their own role in employment and society, and find a professional orientation. The internship can also establish valuable contacts for the students' bachelor's thesis project, for the selection of a Master program graduate school or further employment after graduation. This module is complemented by career advising and several career skills workshops throughout all six semesters that prepare students for the transition from student life to professional life. As an alternative to the full-time internship, students interested in setting up their own company can apply for a start-up option to focus on developing their business plans.

For further information, please contact the Student Career Support (<u>https://www.Constructor-university.de/career-services</u>).

# 2.2.3.2 Specialization Modules

In the third year of their studies, students take 15 CP from major-specific or major-related, advanced Specialization modules to consolidate their knowledge and to be exposed to state-of-the-art research in the areas of their interest. This curricular component is offered as a portfolio of modules, from which students can make free selections during their 5th and 6th semester.

To pursue Mathematics as a major, students take all in all 20 CP from mandatory elective Specialization modules

- MMDA Specialization: Stochastic Processes (me, 5 CP)
- MMDA Specialization: Foundations of Mathematical Physics (me, 5 CP)
- MMDA Specialization: Dynamical Systems (me, 5 CP)
- MMDA Specialization: Topology and Differential Geometry (me, 5 CP)
- MMDA Specialization: Stochastic Modeling and Financial Mathematics (me, 5 CP)

The following modules from Physics and Data Science and master's program in CSSE can substitute up to 5 CP of the above Specialization modules:

- PHDS CORE: Quantum Mechanics (me, 5 CP)
- PHDS CORE: Analytical Mechanics (me, 5 CP)

- PHDS Specialization: Particle Fields and Quanta (me, 5 CP)
- MSc CSSE Specialization: Quantum Informatics (5 CP)

# 2.2.3.3 Study Abroad

Students have the opportunity to study abroad for a semester to extend their knowledge and abilities, broaden their horizons and reflect on their values and behavior in a different context as well as on their role in a global society. For a semester abroad (usually the 5th semester), modules related to the major with a workload equivalent to 22.5 CP must be completed. Modules recognized as study abroad CP need to be pre-approved according to Constructor University study abroad procedures. Several exchange programs allow students to directly enroll at prestigious partner institutions worldwide. Constructor University's participation in Erasmus+, the European Union's exchange program, provides an exchange semester at a number of European universities that include Erasmus study abroad funding.

For further information, please contact the International Programs office (https://constructor.university/student-life/study-abroad/international-office).

Mathematics, Modeling and Data Analytics students that wish to pursue a study abroad in their 5th semester are required to select their modules at the study abroad partners such that they can be used to substitute between 10-15 CP of major-specific Specialization modules and between 5-15 CP of modules equivalent to the non-disciplinary New Skills modules (see CONSTRUCTOR Track). In their 6th semester, according to the study plan, returning study-abroad students complete the Bachelor Thesis/Seminar module (see next section), they take any missing Specialization modules to reach the required 15 CP in this area, and they take any missing New Skills modules to reach 15 CP in this area.

# 2.2.3.4 Bachelor Thesis/Seminar Module

This module is a mandatory graduation requirement for all undergraduate students. It consists of two module components in the major study program guided by a Constructor faculty member: the Bachelor Thesis (12 CP) and a Seminar (3 CP). The title of the thesis will appear on the students' transcripts.

Within this module, students apply the knowledge skills, and methods they have acquired in their major discipline to become acquainted with actual research topics, ranging from the identification of suitable (short-term) research projects, preparatory literature searches, the realization of discipline-specific research, and the documentation, discussion, and interpretation of the results.

With their Bachelor Thesis students demonstrate proficiency in the contents and methods of their major-specific research field. Furthermore, students show the ability to analyze and solve a well-defined problem with scientific approaches, a critical reflection of the status quo in scientific literature, and the original development of their own ideas. With the permission of a Constructor Faculty Supervisor, the Bachelor Thesis can also have an interdisciplinary nature. In the seminar, students present and discuss their theses in a course environment and reflect on their theoretical or experimental approach and conduct. They learn to present their chosen research topics concisely and comprehensively in front of an audience and to explain their methods, solutions, and results to both specialists and non-specialists.

# 2.2.4 The CONSTRUCTOR Track

The CONSTRUCTOR Track is another important feature of Constructor University's educational model. The Constructor Track runs orthogonal to the disciplinary CHOICE, CORE, and CAREER modules across all study years and is an integral part of all undergraduate study programs. It provides an intellectual tool kit for lifelong learning and encourages the use of diverse methodologies to approach crossdisciplinary problems. The CONSTRUCTOR track contains Methods, New Skills and German Language and Humanities modules.

# 2.2.4.1 Methods Modules

Methods such as mathematics, statistics, programming, data handling, presentation skills, academic writing, and scientific and experimental skills are offered to all students as part of the Methods area in their curriculum. The modules that are specifically assigned to each study program equip students with transferable academic skills. They convey and practice specific methods that are indispensable for each students' chosen study program. Students are required to take 20 CP in the Methods area. The size of all Methods modules is 5 CP.

To pursue Mathematics, Modelling and Data Analytics major, the following Methods modules (20 CP) need to be taken as mandatory modules:

- Methods: Matrix Algebra & Advanced Calculus I (m, 5 CP)
- Methods: Matrix Algebra & Advanced Calculus II (m, 5 CP)
- Methods: Probability and Random Processes (m, 5 CP)
- Methods: Statistics and Data Analytics (m, 5 CP)

# 2.2.4.2 New Skills Modules

This part of the curriculum constitutes an intellectual and conceptual tool kit that cultivates the capacity for a particular set of intellectual dispositions including curiosity, imagination, critical thought, and transferability. It nurtures a range of individual and societal capacities, such as self-reflection, argumentation and communication. Finally, it introduces students to the normative aspects of inquiry and research, including the norms governing sourcing, sharing, withholding materials and research results as well as others governing the responsibilities of expertise as well as the professional point of view.

All students are required to take the following modules in their second year:

- New Skills Module: Logic (m, 2.5 CP)
- New Skills Module: Causation and Correlation (m, 2.5 CP)

These modules will be offered with two different perspectives of which the students can choose. The module perspectives are independent modules which examine the topic from different point of views. Please see the module description for more details.

In the third year, students take three 5 CP modules that build upon previous modules in the track and are partially constituted by modules that are more closely linked to each student's disciplinary field of study. The following module is mandatory for all students:

• New Skills Module: Argumentation, Data Visualization and Communication (m, 5 CP)

This module will also be offered with two different perspectives of which the students can choose.

In their fifth semester, students may choose between:

- New Skills Module: Linear Model/Matrices (me, 5 CP) and
- New Skills Module: Complex Problem Solving (me, 5 CP).

The sixth semester also contains the choice between two modules, namely:

- New Skills Module: Agency, Leadership and Accountability (me, 5 CP) and
- New Skills Module: Community Impact Project (me, 5 CP).

Students who study abroad during the fifth semester and are not substituting the mandatory "Argumentation, Data Visualization and Communication" module, are required to take this module during their sixth semester. Students who remain on campus are free to take the Argumentation, Data Visualization and Communication module in either the fifth or sixth semester as they prefer.

# 2.2.4.3 German Language and Humanities Modules

German language abilities foster students' intercultural awareness and enhance their employability in their host country. They are also beneficial for securing mandatory internships (between the 2nd and 3rd year) in German companies and academic institutions. Constructor University supports its students in acquiring basic as well as advanced German skills in the first year of the Constructor Track. Non-native speakers of German are encouraged to take 2 German modules (2.5 CP each), but are not obliged to do so. Native speakers and other students not taking advantage of this offering take alternative modules in Humanities in each of the first two semesters:

- Humanities Module: Introduction to Philosophical Ethics (me, 2.5 CP)
- Humanities Module: Introduction to the Philosophy of Science (me, 2.5 CP)
- Humanities Module: Introduction to Visual Culture (me, 2.5 CP)

#### 3 Mathematics as a Minor

Mathematics is a good choice as a minor for a large range of other majors, as mathematical methods, analytic reasoning, and quantitative skills are useful or even essential in many other fields.

The Mathematics minor is very flexible, with the intention to substantially enhance mathematics skills, develop the ability to reason rigorously, and connect mathematical methods to diverse fields of application.

#### **3.1** Qualification Aims

The key qualification aim is to develop rigorous mathematical thought as a universal transferable skill which can be used in almost all academic and professional environments. Along the way, a student must develop the necessary technical skills in the core areas Analysis and Linear Algebra. Apart from this, the choice of further subject modules is flexible, and students may opt for depth or breadth according to their own interest with the goal of building confidence in interacting with selected advanced mathematical concepts.

For students in Physics, Computer Science, and RIS, a minor in Mathematics, with an appropriate selection module, can directly develop competencies in the theoretical aspects of their chosen major. All other fields of study represented at Constructor University have, at least in the research arena, subfields that involve mathematical modeling, simulation, or theory which is greatly facilitated by a working knowledge of Mathematics corresponding to at least a minor, if not a major, in Mathematics.

#### 3.1.1 Intended Learning Outcomes

With a minor in Mathematics, students will be able to

- 1. understand what constitutes a proof, distinguish heuristics from rigorous arguments, and find gaps in a chain of reasoning;
- 2. make rigorous mathematics arguments in Linear Algebra and Analysis, the two central subject areas in a structured mathematics curriculum;
- 3. understand the key concepts in at least two areas of mathematics, pure or applied, at a more advanced level;
- 4. solve basic problems by applying the standard methods in these fields,
- 5. recognize mathematical structures and formalize descriptions of concepts presented in common language;
- 6. be confident in using mathematical terminology and communicate with mathematicians and non-mathematicians on subjects of mutual interest.

#### 3.2 Module Requirements

A minor in Mathematics requires 30 CP. The option to obtain a minor in Mathematics is marked in the Study and Examination Plan in Chapter 6.

It includes the following 15 CP of CHOICE Modules:

- CHOICE Module: Analysis (m, 7.5 CP)
- CHOICE Module: Linear Algebra (m, 7.5 CP)

The remaining 15 CP include the following second-year Mathematics CORE modules:

- CORE Module: Discrete Mathematics (m, 5 CP)
- CORE Module: Number Theory (m, 5 CP)
- CORE Module: Computational Modeling (m, 5 CP)

It is recommended that students who pursue a minor in Mathematics take the following METHODS Modules in their first year:

- Methods Module: Matrix Algebra and Advanced Calculus I (me, 5 CP)
- Methods Module: Matrix Algebra and Advanced Calculus II (me, 5 CP)

# 3.3 Degree

After successful completion, the minor in Mathematics will be listed on the final transcript under PROGRAM OF STUDY and BA/BSc – [name of the major] as "(Minor: Mathematics)".

#### 4 Mathematics, Modeling and Data Analytics Undergraduate Program Regulations

#### 4.1 Scope of these Regulations

The regulations in this handbook are valid for all students who entered the Mathematics, Modeling and Data Analytics undergraduate program at Constructor University in Fall 2023. In the case of a conflict between the regulations in this handbook and the general Policies for Bachelor Studies, the latter applies (see <a href="https://constructor.university/student-life/student-services/university-policies/academic-policies">https://constructor.university/student-life/student-services/university-policies/academic-policies</a>).

In exceptional cases, certain necessary deviations from the regulations of this study handbook might occur during the course of study (e.g., change of the semester sequence, assessment type, or the teaching mode of courses). Constructor University reserves therefore the right to modify the regulations of the program handbook.

In general, Constructor University reserves therefore the right to change or modify the regulations of the program handbook also after its publication at any time and in its sole discretion.

#### 4.2 Degree

Upon successful completion of the study program, students are awarded a Bachelor of Science degree in Mathematics, Modeling and Data Analytics.

#### 4.3 Graduation Requirements

In order to graduate, students need to obtain 180 CP. In addition, the following graduation requirements apply:

Students need to complete all mandatory components of the program as indicated in the Study and Examination Plan in Chapter 6 of this handbook.

# 5 Schematic Study Plan for Mathematics, Modeling and Data Analytics

This module introdu	ices fundamental c	oncepts and techniques in a c	concise and rigoro	us way. The class co	onveys the	
pleasure of doing m	athematics, and mo	otivates mathematics concepts	from problems an	nd concrete example	s, but also	
shows the power of	abstraction and of f	ormal reasoning.				
The following tenies	will be severed.					
The following topics <ul> <li>Proof by in</li> </ul>		ntary combinatorics				
	uivalence relations,					
		ionals, and real numbers				
	and series, and cor					
		ble, continuity, and the interme	ediate value theore	em,		
		uous functions as a metric space				
		eorem, and the inverse mappin	g theorem in one v	variable		
<ul> <li>Riemann ir</li> </ul>	ntegral					

- Fundamental theorem of Calculus, and the integration by parts with applications
- Integral mean value theorem
- Change of variables
- Taylor series with integral and Lagrange remainders
- Elementary point-set topology (neighborhoods, open and closed sets, compactness, and Heine-Borel)

#### Intended Learning Outcomes

By the end of the module, students will be able to

- 1. cleanly formulate mathematical concepts and results discussed in class;
- 2. outline proofs which have been given in the lectures;
- 3. independently prove results which are direct consequences of those proved in the lectures;
- 4. understand and use fundamental mathematical terminology to communicate mathematics at a university level.

#### Indicative Literature

W. Rudin (1976). Principles of Mathematical Analysis, third edition. New York: McGraw-Hill.

T. Tao (2016). Analysis, third edition. New Delhi: Hindustan Book Agency.

#### Usability and Relationship to other Modules

- This module is part of the core education in Mathematics, Modeling and Data Analytics.
- It is also valuable for students in Physics, Computer Science, RIS, and ECE, either as part of a minor in Mathematics, or as an elective module.
- The curriculum is integrated with the curriculum of the module "Matrix Algebra and Advanced Calculus" in the following way: "Matrix Algebra and Advanced Calculus" emphasizes the operational aspects, computational skills, and intuitive understanding, while Analysis builds rigorous foundations of the field, emphasizing proof, abstraction, and mathematical rigor.

#### Examination Type: Module Examination

Assessment Type: Written examination

Duration: 120 min Weight: 100%

Scope: All intended learning outcomes of this module.

Completion: To pass this module, the examination has to be passed with at least 45%.

#### Intended Learning Outcomes

By the end of the module, students will be able to

- 1. describe the concept of a vector space and linear operator in an abstract way
- 2. explain the connection of abstract linear algebra in the context of matrix algebra
- 3. discuss the proofs of the major theorems from class
- 4. illustrate the use of bilinear forms and their role in geometry
- 5. distinguish bilinear forms in the context of Euclidean, unitary and symplectic spaces

#### Content and Educational Aims

This course provides a solid foundation in imperative programming concepts and techniques, with a focus on Python and C++ programming languages. This course enables students to write programs in Python that solve problems and perform various operations using functions, data structures, and control structures, provides a basic introduction to the C++ programming language and its standard library, with a focus on data structures and algorithms, develops students' problem-solving and algorithmic thinking skills through hands-on programming exercises and projects, fosters students' ability to design, write, and test programs that are robust, maintainable, and scalable, encourages students to pursue further studies and practice in the field of programming and data science.

Content:

- Introduction to Imperative Programming: Overview of basic concepts of imperative programming languages, including variables, assignments, loops, function calls, data structures, and more.
- Python Programming: Writing interactive programs in Python, working with user input, and testing and debugging code.
- Object-Oriented Programming in Python: Overview of basic object-oriented programming concepts, such as objects, classes, information hiding, inheritance, and function and operator overloading.
- File Input/Output in Python: Retrieving and processing data from/to files and generating data using Python.
- Scientific Computing with Python: Using NumPy arrays for vectorized code and SciPy for special functions and black-boxed algorithms (root solvers, quadrature, ODE solvers, and fast Fourier transform).

- Visualization in Python: Visualizing data using Matplotlib.
- Introduction to C++ Programming: Writing basic programs in C++ using standard library functions.
- Pointers in C++: Using pointers to create dynamically allocated data structures, such as linked lists, and understanding the relationship between pointers and arrays.
- Standard Library Data Types in C++: Overview of C++ standard library data types, including vector, string, list, map, set, and sort.
- Risks and Limitations of C/C++: Understanding the risks of C/C++ programming, including implicit type conversions, lack of bounds checking, and manual memory ownership management.

#### Intended Learning Outcomes

Upon completion of this module, students will be able to

- 1. explain basic concepts of imperative programming languages such as variables, assignments, loops, function calls, data structures, etc.;
- 2. work with user input from the keyboard, write interactive Python programs;
- 3. write, test, and debug programs;
- 4. illustrate basic object-oriented programming concepts such as objects, classes, information hiding and inheritance;
- 5. give original examples of function and operator overloading;
- 6. retrieve data and process and generate data from/to files;
- 7. write vectorized code using NumPy arrays
- 8. use SciPy for special functions and black-boxed algorithms (root solvers, quadrature, ODE solvers, and fast Fourier transform)
- 9. visualize data in appropriate ways using Matplotlib
- 10. write basic programs in the programming languages C/C++ using standard library functions
- 11. demonstrate how to use pointers to create dynamically allocated data structures such as linked lists;
- 12. explain the relationship between pointers and arrays;
- 13. use C++ standard library data types (vector, string, list, map, set, sort);
- 14. describe C/C++ risks (implicit type conversions, lack of bounds checking, manual memory ownership management)

Recommendations fo • Recap basic Content and Educatio	Calculus and Linear Algebra knowledge			

The idea of this module is to introduce and teach mathematical methods starting with concrete scientific problems (mostly but not exclusively taken from physics). This module thus provides a first introduction to mathematical modeling, with an emphasis of the modeling of phenomena in physics, but also in other fields such as biology, economy, engineering, environmental sciences, finance, and industry. In modeling, we face two difficulties: Firstly, we have to find a good mathematical representation of the problem at hand, and secondly, we need to solve this problem either exactly, or with approximate analytical or numerical techniques. This class focuses mostly on deterministic problems, and discusses stochastic problems only briefly. The main mathematical techniques come from Analysis/Calculus, Linear Algebra, Differential Equations, and Probability. In the Mathematical Modeling Lab, the students work independently and in groups to find formulations of modeling problems and their solutions.

The following topics will be covered:

- Population Dynamics
- Fluid Mechanics
- Systems of Linear Equations
- Electrical Networks
- Linear Programming
- The Ideal Gas
- First and Second Laws of Thermodynamics
- Harmonic Oscillator
- ODEs and Phase Space
- Stability of Linear Systems
- Electromagnetism and Wave Equation
- Brownian Motion
- Monte-Carlo Method

The following mathematical skills will be covered and developed:

- derivatives and integration in one variable
- derivatives and integration in many variables
- integral theorems: Gauß and Stokes
- extreme value problems
- Taylor series
- Fourier series
- ODEs
- elementary introduction to PDEs
- elementary probability and stochastic processes

#### Intended Learning Outcomes

Upon completion of this module, students will be able to

- 1. formulate mathematical models of problems from the sciences
- 2. describe solution methods to modeling problems
- 3. explain the usage of analysis and linear algebra techniques in modeling
- 4. recognize different solution methods for modeling problems
- 5. illustrate the use of ODEs and PDEs to describe phenomena in physics
- 6. solve simple stochastic modeling problems

#### Indicative Literature

C/C++		Duration 1 semester	Workload 187.5 hours		

Students should refresh their knowledge of the C, C++ and Python programming language and be able to solve simple programming problems in C, C++ and Python. Students are expected to have a working programming environment.

#### **Content and Educational Aims**

Algorithms and data structures are the foundation of computer science and are crucial for the design and implementation of efficient software programs. In this course, students will learn about fundamental algorithms for solving problems and about data structures for storing, accessing, and modifying data in an efficient manner. They will also learn techniques for analyzing the computational and memory complexities of algorithms and data structures. These concepts and techniques form the basis for almost all computer programs and are essential for success in the fields of data science and software development.

Content:

- Introduction (asymptotic analysis of algorithms, analysis of recurrence relations, sums and integrals, time complexity, non-asymptotic optimizations, cache)
- Basic data structures (array, list, stack, queue, vector, hash tables, binary heap, heapsort, etc.)
- Sorting algorithms and heaps (quadratic sorting, stable sorting, mergesort, etc.)
- Graphs: depth-first search (DFS) and breadth-first search (BFS) algorithms.
- Graphs: matchings, colorings, flows, cuts.
- Graphs: shortest paths
- Introduction to Complexity Theory, Probabilistic Algorithms
- Numerical and Algebraic Algorithms

#### Intended Learning Outcomes

Upon completion of this module, students will be able to

- 1. Analyze the time and space complexity of algorithms and optimize them using asymptotic analysis and nonasymptotic techniques such as cache optimization.
- 2. Implement and evaluate various data structures including arrays, lists, stacks, queues, vectors, hash tables, binary heaps, and heapsort.
- 3. Compare and contrast different sorting algorithms, including quadratic sorting, stable sorting, and mergesort, and understand the trade-offs involved in their use.
- 4. Implement depth-first search (DFS) and breadth-first search (BFS) algorithms and understand their applications in graph theory.
- 5. Analyze matchings, colorings, flows, and cuts in graphs, and understand the algorithms and mathematical foundations used to solve these problems.
- 6. Implement shortest path algorithms in graphs and understand their applications in network design and routing.
- 7. Understand the fundamental concepts of complexity theory and probabilistic algorithms, and apply them in solving computational problems.
- 8. Analyze and implement numerical and algebraic algorithms and understand their applications in a variety of fields.
- 9. Develop the ability to analyze, design, and implement algorithms for solving real-world problems and understand the trade-offs involved in their use.

#### **Recommendations for Preparation**

Students should refresh their knowledge of the C and C++ programming language and be able to solve simple programming problems in C and C++. Students are expected to have a working programming environment.

#### **Content and Educational Aims**

Algorithms and data structures are the core of computer science. An algorithm is an effective description for calculations using a finite list of instructions that can be executed by a computer. A data structure is a concept for organizing data in a computer such that data can be used efficiently. This introductory module allows students to learn about fundamental algorithms for solving problems efficiently. It introduces basic algorithmic concepts; fundamental data structures for efficiently storing, accessing, and modifying data; and techniques that can be used for the analysis of algorithms and data structures with respect to their computational and memory complexities. The presented concepts and techniques form the basis of almost all computer programs.

#### Intended Learning Outcomes

By the end of this module, students will be able to

- 1. explain asymptotic (time and memory) complexities and respective notations;
- 2. able to prove asymptotic complexities of algorithms;
- 3. illustrate basic data structures such as arrays, lists, queues, stacks, trees, and hash tables;
- 4. describe algorithmic design concepts and apply them to new problems;
- 5. explain basic algorithms (sorting, searching, graph algorithms, computational geometry) and their complexities;
- 6. summarize and apply C++ templates and generic data structures provided by the standard C++ template library.

#### Indicative Literature

Donald E. Knuth: The Art of Computer Programming: Fundamental Algorithms, volume 1, 3rd edition, Addison Wesley Longman Publishing, 1997.

#### Usability and Relationship to other Modules

• Familiarity with basic algorithms and data structures is fundamental for almost all advanced modules in computer science. This module additionally introduces advanced concepts of the C++ programming language that are needed in advanced programming-oriented modules in the 2<sup>nd</sup> and 3<sup>rd</sup> years of the CS and RIS programs.

- Some basic familiarity with linear algebra is useful, but not technically required.
- It is recommended to have taken the Methods module: Calculus and Elements of Linear Algebra I + II

#### **Content and Educational Aims**

This module is an introductory lecture in discrete mathematics. The lecture consists of two main components, enumerative combinatorics and graph theory. The lecture emphasizes connections of discrete mathematics with other areas of mathematics such as linear algebra and basic probability, and outlines applications to areas of computer science, cryptography, etc. where employment of ideas from discrete mathematics has proven to be fruitful. The first part of the lecture—enumerative combinatorics—deals with several classical enumeration problems (Binomial coefficients, Stirling numbers), counting under group actions and generating function. The second half of the lecture—graph theory—includes a discussion of basic notions such as chromatic number, planarity, matchings in graphs, Ramsey theory, and expanders, and their applications.

#### **Intended Learning Outcomes**

By the end of the module, students will be able to

- 1. demonstrate their mastery of basic tools in discrete mathematics.
- 2. develop the ability to use discrete mathematics concepts (such as graphs) to model problems in computer science.
- 3. analyze the definition of basic combinatorial objects such as graphs, permutations, partitions, etc.
- 4. formulate and design methods and algorithms for solving applied problems based on concepts from discrete mathematics.

#### Indicative Literature

J.H. van Lint and R.M. Wilson (2001). A Course in Combinatorics, second edition. Cambridge: Cambridge University Press.

### Intended Learning Outcomes

Upon completion of this module, students will be able to

- 1. perform curve and model fitting
- 2. conduct advanced data Analysis including Fourier analysis and Bayesian statistics
- 3. understand error handling in multidimensional complex data analysis
- 4. store, import, handle and visualize large data sets

#### **Content and Educational Aims**

Machine learning (ML) concerns algorithms that are fed with (large quantities of) real-world data, and which return a compressed "model" of the data. An example is the "world model" of a robot; the input data are sensor data streams, from which the robot learns a model of its environment, which is needed, for instance, for navigation. Another example is a spoken language model; the input data are speech recordings, from which ML methods build a model of spoken English; this is useful, for instance, in automated speech recognition systems. There exist many formalisms in which such models can be cast, and an equally large diversity of learning algorithms. However, there is a relatively small number of fundamental challenges that are common to all of these formalisms and algorithms. The lectures introduce such fundamental concepts and illustrate them with a choice of elementary model formalisms (linear classifiers and regressors, radial basis function networks, clustering, online adaptive filters, neural networks, or hidden Markov models). Furthermore, the lectures also (re-)introduce required mathematical material from probability theory and linear algebra.

#### **Intended Learning Outcomes**

By the end of this module, students should be able to

- 1. understand the notion of probability spaces and random variables;
- 2. understand basic linear modeling and estimation techniques;
- 3. understand the fundamental nature of the "curse of dimensionality;"
- 4. understand the fundamental nature of the bias-variance problem and standard coping strategies;
- 5. use elementary classification learning methods (linear discrimination, radial basis function networks, multilayer perceptrons);
- 6. implement an end-to-end learning suite, including feature extraction and objective function optimization with regularization based on cross-validation.

#### Usability and Relationship to other Modules

• This module gives a thorough introduction to the basics of machine learning. It complements the Artificial Intelligence module.

#### **Recommendations for Preparation**

Review material from pre-requisite modules, especially Applied Mathematics. Having taken Applied Mathematics is recommended.

#### **Content and Educational Aims**

This module is about the application of mathematics in physics. Physics and mathematics have a very intimate relationship. On the one hand, big discoveries in physics have often led to interesting new mathematics, and on the other hand, new developments in mathematics have made possible new discoveries in physics. The goal of this module is to look at some examples of that, and to gain an insight into what role rigorous mathematics has played and plays today in explaining physical phenomena. This class discusses examples from the major theories of classical mechanics, quantum mechanics, electrodynamics, and statistical mechanics.

A selection of the following topics will be covered:

- Mathematical foundations of classical mechanics
- Hamiltonian dynamics and symplectic geometry
- Integrable systems
- Special functions
- Mathematical foundations of quantum mechanics
- Quantum entanglement
- Fourier analysis
- Variational methods
- Non-linear partial differential equations from physics
- Scattering theory
- Many-body quantum mechanics and second quantization
- Geometric foundations (differential geometry)
- Mathematical problems in statistical mechanics and other fields of physics

Intended Learning Outcomes

By the end of the module, students will be able to

- 1. demonstrate the application of mathematics in the context of physics
- 2. explain the mathematical foundations of classical mechanics, quantum mechanics, statistical physics, and electrodynamics
- 3. discuss the solutions to both linear and non-linear equations in physics
- 4. breakdown the Hamiltonian formalism in the context of classical and quantum mechanics
- 5. apply variational methods and their role in minimization and maximization problems

• Pre-install Anaconda Python on your own laptop and know how to edit and start simple Python programs in a Python IDE like Spyder (which comes bundled as part of Anaconda Python).

### **Content and Educational Aims**

This module is a first hands-on introduction to stochastic modeling. Examples will mostly come from the area of Financial Mathematics, so that this module plays a central role in the education of students interested in Quantitative Finance and Mathematical Economics. The module is taught as an integrated lecture-lab, where short theoretical units are interspersed with interactive computation and computer experiments.

Topics include a short introduction to the basic notions of financial mathematics, binomial tree models, discrete Brownian paths, stochastic integrals and ODEs, Ito's Lemma, Monte-Carlo methods, finite differences solutions, the Black-Scholes equation, and an introduction to time series analysis, parameter estimation, and calibration. Towards the end, the Fokker-Planck equation, Ornstein-Uhlenbeck processes, and nonlinear Stochastic Partial Differential Equations are discussed, and connections to applications in physics and other areas of mathematics are made. Students will program and explore all basic techniques in a numerical programming environment and apply these algorithms to real data whenever possible.

#### **Intended Learning Outcomes**

Upon completion of this module, students will be able to

- 1. apply fundamental concepts of deterministic and stochastic modeling;
- 2. design, conduct, and interpret controlled in-silico scientific experiments;
- 3. analyze the basic concepts of financial mathematics and their role in finance;
- 4. write computer code for basic financial calculations, binomial trees, stochastic differential equations, stochastic integrals and time series analysis;
- 5. compare their programs and predictions in the context of real data;
- 6. demonstrate the usage of a version control system for collaboration and the submission of code and reports.

#### Usability and Relationship to other Modules

- This module is part of the core education in Mathematics, Modeling and Data Analytics.
- It is also valuable for students in Physics and Data Science, Computer Science, Data Engineering, RIS, and ECE, either as part of a minor in Mathematics, or as an elective module.

#### Recommendations for Preparation

Review classical mechanics, calculus and linear algebra at the level of the first-year courses.

#### Content and Educational Aims

Mechanics provides the foundation for all other fields of physics. The analytical techniques developed in mechanics have applications in many other sciences, engineering, mathematics and even economics. This module provides an intensive calculus-based introduction to analytical mechanics including aspects of special relativity. Topics include Newton's laws, the kinematics and dynamics of systems of particles, planetary motion, rigid body mechanics, Lagrangian mechanics, variational techniques, symmetries and conservation laws, optimization with constraints and Lagrange multipliers, Hamiltonian mechanics, canonical transformations, Hamilton-Jacobi theory, Liouville theorem, small oscillations, and relativistic mechanics. Additional topics may include continuum mechanics and an outlook to general relativity. The course is part of the core physics education and builds on the foundation of the Classical Physics and Mathematical Modeling modules. The course is, however, also accessible and of interest to students without this prerequisite, but with a sufficiently strong background in mathematics. Essential practical experience in analyzing physical phenomena, formulating mathematical models and solving physics problems will be supported by homework exercises in close coordination with the lectures. The aim of the module is an introduction to the core topics of physics at a level that prepares students for BSc thesis research. At the same time, students' mathematical repertoires and problem-solving skills are developed. The module also serves as a foundation for specialization subject courses

#### Intended Learning Outcomes

By the end of the module, students will be able to

- 1. understand the classical foundations of physics;
- 2. solve mechanics problems of practical relevance using advanced mathematical techniques;
- 3. analyze mechanical systems using Newton's laws and re-formulate them in terms of Lagrangian and Hamiltonian mechanics;
- formulate physical laws using variational methods and derive the equations of the motion of physical systems;
- 5. model and analyze systems beyond mechanics using methods and techniques of analytical mechanics;
- 6. derive the equivalence of energy and matter in the framework of the special theory of relativity;
- 7. understand Lorentz transformations and apply them;
- 8. communicate in scientific language using advanced field-specific technical terms.

#### **Recommendations for Preparation**

• Please see the section "Knowledge Center" at JobTeaser Career Center for information on Career Skills seminar and workshop offers and for online tutorials on the job market preparation and the application process. For more information, please see <a href="https://constructor.university/student-life/career-services">https://constructor.university/student-life/career-services</a>

• Participating in the internship events of earlier classes

#### Content and Educational Aims

The aims of the internship module are reflection, application, orientation, and development: for students to reflect on their interests, knowledge, skills, their role in society, the relevance of their major subject to society, to apply these skills and this knowledge in real life whilst getting practical experience, to find a professional orientation, and to develop their personality and in their career. This module supports the programs' aims of preparing students for gainful, qualified employment and the development of their personality

The full-time internship must be related to the students' major area of study and extends lasts a minimum of two consecutive months, normally scheduled just before the 5th semester, with the internship event and submission of the internship report in the 5th semester. Upon approval by the SPC and SCS, the internship may take place at other times, such as before teaching starts in the 3rd semester or after teaching finishes in the 6th semester. The Study Program Coordinator or their faculty delegate approves the intended internship a priori by reviewing the tasks in either the Internship Contract or Internship

Confirmation from the respective internship institution or company. Further regulations as set out in the Policies for Bachelor Studies apply.

Students will be gradually prepared for the internship in semesters 1 to 4 through a series of mandatory information sessions, seminars, and career events. The purpose of the Student Career Support Information Sessions is to provide all students with basic facts about the job market in general, and especially in Germany and the EU, and services provided by the Student Career Support.

In the Career Skills Seminars, students will learn how to engage in the internship/job search, how to create a competitive application (CV, Cover Letter, etc.), and how to successfully conduct themselves at job interviews and/or assessment centers. In addition to these mandatory sections, students can customize their skill set regarding application challenges and their intended career path in elective seminars.

Finally, during the Career Events organized by the Student Career Support(e.g. the annual Constructor Career Fair and single employer events on and off campus), students will have the opportunity to apply their acquired job market skills in an actual internship/job search situation and to gain their desired internship in a high-quality environment and with excellent employers.

As an alternative to the full-time internship, students can apply for the StartUp Option. Following the same schedule as the full-time internship, the StartUp Option allows students who are particularly interested in founding their own company to focus on the development of their business plan over a period of two consecutive months. Participation in the StartUp Option depends on a successful presentation of the student's initial StartUp idea. This presentation will be held at the beginning of the 4th semester. A jury of faculty members will judge the student's potential to realize their idea and approve the participation of the students. The StartUp Option is supervised by the Faculty StartUp Coordinator. At the end of StartUp Option, students submit their business plan. Further regulations as outlined in the Policies for Bachelor Studies apply.

The concluding Internship Event will be conducted within each study program (or a cluster of related study programs) and will formally conclude the module by providing students the opportunity to present on their internships and reflect on the lessons learned within their major area of study. The purpose of this event is not only to self-reflect on the whole internship process, but also to create a professional network within the academic community, especially by entering the Alumni Network after graduation. It is recommended that all three classes (years) of the same major are present at this event to enable networking between older and younger students and to create an educational environment for younger students to observe the "lessons learned" from the diverse internships of their elder fellow students.

Intended Learning Outcomes

By the end of this module, students should be able to

- 1. describe the scope and the functions of the employment market and personal career development;
- 2. apply professional, personal, and career-related skills for the modern labor market, including self-organization, initiative and responsibility, communication, intercultural sensitivity, team and leadership skills, etc.;
- 3. independently manage their own career orientation processes by identifying personal interests, selecting appropriate internship locations or start-up opportunities, conducting interviews, succeeding at pitches or assessment centers, negotiating related employment, managing their funding or support conditions (such as salary, contract, funding, supplies, workspace, etc.);
- 4. apply specialist skills and knowledge acquired during their studies to solve problems in a professional environment and reflect on their relevance in employment and society;
- 5. justify professional decisions based on theoretical knowledge and academic methods;
- 6. reflect on their professional conduct in the context of the expectations of and consequences for employers and their society;
- 7. reflect on and set their own targets for the further development of their knowledge, skills, interests, and values;
- 8. establish and expand their contacts with potential employers or business partners, and possibly other students and alumni, to build their own professional network to create employment opportunities in the future;
- 9. discuss observations and reflections in a professional network.

#### **Indicative Literature**

Not specified

#### Usability and Relationship to other Modules

• This module applies skills and knowledge acquired in previous modules to a professional environment and provides an opportunity to reflect on their relevance in employment and society. It may lead to thesis topics.

**Examination Type: Module Examination** 

Assessment Type: Project Report Scope: All intended learning outcomes Length: approx. 3.500 words Weight: 100%

## **Content and Educational Aims**

This module is a mandatory graduation requirement for all undergraduate students to demonstrate their ability to deal with a problem from their respective major subject independently by means of academic/scientific methods within a set period. Although supervised, the module requires students to be able to work independently and regularly and set their own goals in exchange for the opportunity to explore a topic that excites and interests them personally and which a faculty member is interested to supervise. Within this module, students apply their acquired knowledge about the major discipline, skills, and methods to conduct research, ranging from the identification of suitable (short-term) research projects, preparatory literature searches, the realization of discipline-specific research, and the documentation, discussion, interpretation and communication of the results.

This module consists of two components, an independent thesis and an accompanying seminar. The thesis component must be supervised by a Constructor University faculty member and requires short-term research work, the results of which must be documented in a comprehensive written thesis including an introduction, a justification of the methods, results, a discussion of the results, and conclusions. The seminar provides students with the opportunity to present, discuss and justify their and other students' approaches, methods and results at various stages of their research to practice

these skills to improve their academic writing, receive and reflect on formative feedback, thereby growing personally and professionally.

#### Intended Learning Outcomes

On completion of this module, students should be able to

- 1. independently plan and organize advanced learning processes;
- 2. design and implement appropriate research methods taking full account of the range of alternative techniques and approaches;
- 3. collect, assess and interpret relevant information;
- 4. draw scientifically founded conclusions that consider social, scientific and ethical insights;
- 5. apply their knowledge and understanding to a context of their choice;
- 6. develop, formulate and advance solutions to problems and arguments in their subject area, and defend these through argument;
- 7. discuss information, ideas, problems and solutions with specialists and non-specialists.

#### Usability and Relationship to other Modules

• This module builds on all previous modules of the program. Students apply the knowledge, skills and competencies they acquired and practiced during their studies, including research methods and the ability to acquire additional skills independently as and if required.

## **Examination Type: Module Component Examinations**

**Module Component 1: Thesis** Assessment type: Thesis Scope: All intended learning outcomes, mainly 1-6.

### Module Component 2: Seminar

Assessment type: Presentation

excluding front and back matter. Weight: 80%

Length: approx. 6.000 - 8.000 words (15 - 25 pages),

Duration: approx. 15 to 30 minutes Weight: 20%

Scope: The presentation focuses mainly on ILOs 6 and 7, but by nature of these ILOs it also touches on the others.

Completion: To pass this module, both module component examinations have to be passed with at least 45%.

Two separate assessments are justified by the size of this module and the fact that the justification of solutions to problems and arguments (ILO 6) and discussion (ILO 7) should at least have verbal elements. The weights of the types of assessments are commensurate with the sizes of the respective module components.

Review of high school mathematics.

#### **Content and Educational Aims**

This module is the first in a sequence including advanced mathematical methods at the university level at a level higher than the course Calculus and Linear Algebra I. The course comprises the following topics:

- Number systems, complex numbers
- The concept of function, composition of functions, inverse functions
- Basic ideas of calculus: Archimedes to Newton
- The notion of limit for functions and sequences and series
- Continuous function and their basic properties
- Derivatives: rate of change, velocity and applications
- Mean value theorem and estimation, maxima and minima, convex functions
- Integration, change of variables, Fundamental Theorem of Calculus
- Applications of the integral: work, area, average value, centre of mass
- Improper Integrals, Mean value theorem for integrals
- Taylor series
- Ordinary differential equations, examples, solving first order linear differential equations
- Basic ideas of numerical analysis, Newton's method, asymptotic formulas
- Review of elementary analytic geometry, lines, conics

- Vector spaces, linear independence, bases, coordinates
- Linear maps, matrices and their algebra, matrix inverses
- Gaussian elimination, solution space
- Determinants

## **Intended Learning Outcomes**

Upon completion of this module, students will be able to

- 1. apply the methods described in the content section of this module description to the extent that they can
- 2. solve standard text-book problems reliably and with confidence;
- 3. recognize the mathematical structures in an unfamiliar context and translate them into a mathematical problem statement;
- 4. recognize common mathematical terminology used in textbooks and research papers in the quantitative sciences, engineering, and mathematics to the extent that they fall into the content categories covered in this module.

## Indicative Literature

Advanced Calculus, G.B. Folland (Pearson, 2002)

Linear Algebra, S. Lang (Springer Verlag, 1986)

Mathematical Methods for Physics and Engineering,

K. Riley, M. Hobson, S. Bence (Cambridge University Press, 2006)

## Usability and Relationship to other Modules

- Calculus and Linear Algebra I can be substituted with this module after consulting academic advisor
- A more advanced treatment of multi-variable Calculus, in particular, its applications in Physics and Mathematics, is provided in the second-semester module "Applied Mathematics". All students taking "Applied Mathematics" are expected to take this module as well as the module topics are closely synchronized.
- The second-semester module "Linear Algebra" provides a complete proof-driven development of the theory of Linear Algebra. Diagonalization is covered more abstractly, with particular emphasis on degenerate cases. The Jordan normal form is also covered in "Linear Algebra", not in this module.

**Examination Type: Module Examination** 

Assessment Type: Written examination

Duration: 120 min Weight: 100%

Scope: All intended learning outcomes of the module.

Review all of the first-year calculus and linear algebra modules as indicated in "Entry Requirements – Knowledge, Ability, or Skills" above.

### **Content and Educational Aims**

This module aims to provide a basic knowledge of probability theory and random processes suitable for students in engineering, Computer Science, and Mathematics. The module provides students with basic skills needed for formulating real-world problems dealing with randomness and probability in mathematical language, and methods for applying a toolkit to solve these problems. Mathematical rigor is used where appropriate. A more advanced treatment of the subject is deferred to the third-year module Stochastic Processes.

The lecture comprises the following topics

- Brief review of number systems, elementary functions, and their graphs
- Outcomes, events and sample space.
- Combinatorial probability.
- Conditional probability and Bayes' formula.
- Binomials and Poisson-Approximation
- Random Variables, distribution and density functions.
- Independence of random variables.
- Conditional Distributions and Densities.
- Transformation of random variables.
- Joint distribution of random variables and their transformations.
- Expected Values and Moments, Covariance.
- High dimensional probability: Chebyshev and Chernoff bounds.
- Moment-Generating Functions and Characteristic Functions,
- The Central limit theorem.
- Random Vectors and Moments, Covariance matrix, Decorrelation.
- Multivariate normal distribution.Markov chains, stationary distributions.
- Markov chains, stationary distributions

## Intended Learning Outcomes

By the end of the module, students will be able to

- 1. command the methods described in the content section of this module description to the extent that they can solve standard text-book problems reliably and with confidence;
- 2. recognize the probabilistic structures in an unfamiliar context and translate them into a mathematical problem statement;
- 3. recognize common mathematical terminology used in textbooks and research papers in the quantitative sciences, engineering, and mathematics to the extent that they fall into the content categories covered in this module.

Recommendation	ns for Preparation					
Content and Edu	cational Aims					
	asks you to help solve a d			, .		
	figure out what the hea		-			

task you face is to figure out what the heart of the problem actually is. In doing that you will look for structural similarities between the problem posed and other problems that arise in different fields that others may have addressed successfully. Those similarities may point you to a pathway for resolving the problem you have been asked to solve. But it is not enough to look for structural similarities. Sometimes relying on similarities may even be misleading. Once you've settled tentatively on what you take to be the heart of the matter, you will naturally look for materials, whether evidence or arguments, that you believe is relevant to its potential solution. But the evidence you investigate of course depends on your formulation of the problem, and your formulation of the problem likely depends on the tools you have available – including potential sources of evidence and argumentation. You cannot ignore this interactivity, but you can't allow yourself to be hamstrung entirely by it. But there is more. The problem itself may be too big to be manageable all at once, so you will have to explore whether it can be broken into manageable parts and if the information you have bears on all or only some of those parts. And later you will face the problem of whether the solutions to the particular sub problems can be put together coherently to solve the entire problem taken as a whole.

What you are doing is what we call engaging in computational thinking. There are several elements of computational thinking illustrated above. These include: Decomposition (breaking the larger problem down into smaller ones); Pattern recognition (identifying structural similarities); Abstraction (ignoring irrelevant particulars of the problem): and Creating Algorithms), problem-solving formulas.

But even more basic to what you are doing is the process of drawing inferences from the material you have. After all, how else are you going to create a problem-solving formula, if you draw incorrect inferences about what information has shown and what, if anything follows logically from it. What you must do is apply the rules of logic to the information to draw inferences that are warranted.

We distinguish between informal and formal systems of logic, both of which are designed to indicate fallacies as well as warranted inferences. If I argue for a conclusion by appealing to my physical ability to coerce you, I prove nothing about the truth of what I claim. If anything, by doing so I display my lack of confidence in my argument. Or if the best I can do is berate you for your skepticism, I have done little more than offer an ad hominem instead of an argument. Our focus will be on formal systems of logic, since they are at the heart of both scientific argumentation and computer developed algorithms. There are in fact many different kinds of logic and all figure to varying degrees in scientific inquiry. There are inductive types of logic, which purport to formalize the relationship between premises that if true offer evidence on behalf of a conclusion and the conclusion and are represented as claims about the extent to which the conclusion is confirmed by the premises. There are deductive types of logic, which introduce a different relationship between premise are true then the conclusion too must be true.

There are also modal types of logic which are applied specifically to the concepts of necessity and possibility, and thus to the relationship among sentences that include either or both those terms. And there is also what are called deontic logic, a modification of logic that purport to show that there are rules of inference that allow us to infer what we ought to do from facts about the circumstances in which we find ourselves. In the natural and social sciences most of the emphasis has been placed on inductive logic, whereas in math it is placed on deductive logic, and in modern physics there is an increasing interest in the concepts of possibility and necessity and thus in modal logic. The humanities, especially normative discussions in philosophy and literature are the province of deontic logic.

This module will also take students through the central aspects of computational thinking, as it is related to logic; it will introduce the central concepts in each, their relationship to one another and begin to provide the conceptual apparatus and practical skills for scientific inquiry and research.

#### **Intended Learning Outcomes**

Students acquire transferable and key skills in this module.

By the end of this module, the students will be able to

- 1. apply the various principles of logic and expand them to computational thinking.
- 2. understand the way in which logical processes in humans and in computers are similar and different at the same time.
- 3. apply the basic rules of first-order deductive logic and employ them rules in the context of creating a scientific or social scientific study and argument.
- 4. employ those rules in the context of creating a scientific or social scientific study and argument

## **Content and Educational Aims**

The focus of this module is on formal systems of logic, since they are at the heart of both scientific argumentation and computer developed algorithms. There are in fact many kinds of logic and all figure to varying degrees in scientific inquiry. There are inductive types of logic, which purport to formalize the relationship between premises that if true offer evidence on behalf of a conclusion and the conclusion and are represented as claims about the extent to which the conclusion is confirmed by the premises. There are deductive types of logic, which introduce a different relationship between premise and conclusion. These variations of logic consist in rules that if followed entail that if the premises are true then the conclusion too must be true.

This module introduces logics that go beyond traditional deductive propositional logic and predicate logic and as such it is aimed at students who are already familiar with basics of traditional formal logic. The aim of the module is to provide an overview of alternative logics and to develop a sensitivity that there are many different logics that can provide effective tools for solving problems in specific application domains.

The module first reviews the principles of a traditional logic and then introduces many-valued logics that distinguish more than two truth values, for example true, false, and unknown. Fuzzy logic extends traditional logic by replacing truth values with real numbers in the range 0 to 1 that are expressing how strong the believe into a proposition is. Modal logics introduce modal operators expressing whether a proposition is necessary or possible. Temporal logics deal with propositions that are qualified by time. Once can view temporal logics as a form of modal logics where propositions are qualified by time constraints. Interval temporal logic provides a way to reason about time intervals in which propositions are true.

The module will also investigate the application of logic frameworks to specific classes of problems. For example, a special subset of predicate logic, based on so-called Horn clauses, forms the basis of logic programming languages such as Prolog. Description logics, which are usually decidable logics, are used to model relationships and they have applications in the semantic web, which enables search engines to reason about resources present on the Internet.

### Intended Learning Outcomes

Students acquire transferable and key skills in this module.

By the end of this module, the students will be able to

- 1. apply the various principles of logic
- 2. explain practical relevance of non-standard logic
- 3. describe how many-valued logic extends basic predicate logic
- 4. apply basic rules of fuzzy logic to calculate partial truth values
- 5. sketch basic rules of temporal logic
- 6. implement predicates in a logic programming language
- 7. prove some simple non-standard logic theorems

## **Content and Educational Aims**

In many ways, life is a journey. And also, as in other journeys, our success or failure depends not only on our personal traits and character, our physical and mental health, but also on the accuracy of our map. We need to know what the world we are navigating is actually like, the how, why and the what of what makes it work the way it does. The natural sciences provide the most important tool we have developed to learn how the world works and why it works the way it does. The social sciences provide the most advanced tools we have to learn how we and other human beings, similar in most ways, different in many others, act and react and what makes them do what they do. In order for our maps to be useful, they must be accurate and correctly reflect the way the natural and social worlds work and why they work as they do.

The natural sciences and social sciences are blessed with enormous amounts of data. In this way, 87 istoryy and the present are gifts to us. To understand how and why the world works the way it does requires that we are able to offer an explanation of it. The data supports a number of possible explanations of it. How are we to choose among potential explanations? Explanations, if sound, will enable us to make reliable predictions about what the future will be like, and also to identify many possibilities that may unfold in the future. But there are differences not just in the degree of confidence we have in our predictions, but in whether some of them are necessary future states or whether all of them are merely possibilities? Thus, there are three related activities at the core of scientific inquiry: understanding where we are now and how we got here (historical); knowing what to expect going forward (prediction); and exploring how we can change the paths we are on (creativity).

At the heart of these activities are certain fundamental concepts, all of which are related to the scientific quest to uncover immutable and unchanging laws of nature. Laws of nature are thought to reflect <u>a causal</u> nexus between a previous event and a future one. There are also true statements that reflect universal or nearly universal connections between events past and present that are not laws of nature because the relationship they express is that of <u>a correlation</u> between events. A working thermostat accurately allows us to determine or even to predict the temperature in the room in which it is located, but it does not explain why the room has the temperature it has. What then is the core difference between causal relationships and correlations? At the same time, we all recognize that given where we are now there are many possible futures for each of us, and even had our lives gone just the slightest bit differently than they have, our present state could well have been very different than it is. The relationship between possible pathways between events that have not materialized but could have is expressed through the idea of <u>counterfactual</u>.

Creating accurate roadmaps, forming expectations we can rely on, making the world a more verdant and attractive place requires us to understand the concepts of causation, correlation, counterfactual explanation, prediction, necessity, possibility, law of nature and universal generalization. This course is designed precisely to provide the conceptual tools and intellectual skills to implement those concepts in our future readings and research and ultimately in our experimental investigations, and to employ those tools in various disciplines.

### **Intended Learning Outcomes**

Students acquire transferable and key skills in this module.

By the end of this module, the students will be able to

- 1. formulate testable hypotheses that are designed to reveal causal connections and those designed to reveal interesting, important and useful correlations.
- 2. distinguish scientifically interesting correlations from unimportant ones.
- 3. apply critical thinking skills to evaluate information.
- 4. understand when and why inquiry into unrealized possibility is important and relevant.

## Content and Educational Aims

Causality or causation is a surprisingly difficult concept to understand. David Hume famously noted that causality is a concept that our science and philosophy cannot do without, but it is equally a concept that our science and philosophy cannot describe. Since Hume, the problem of cause has not gone away, and sometimes seems to get even worse (e.g., quantum mechanics confusing previous notions of causality). Yet, ways of doing science that lessen our need to explicitly use causality have become very effective (e.g., huge developments in statistics). Nevertheless, it still seems that the concept of causality is at the core of explaining how the world works, across fields as diverse as physics, medicine, logistics, the law, sociology, and history – and ordinary daily life – through all of which, explanations and predictions in terms of cause and effect remain intuitively central.

Causality remains a thorny problem but, in recent decades, significant progress has occurred, particularly in work by or inspired by Judea Pearl. This work incorporates many 20<sup>th</sup> century developments, including statistical methods – but with a reemphasis on finding the why, or the cause, behind statistical correlations –, progress in understanding the logic, semantics and metaphysics of conditionals and counterfactuals, developments based on insights from the likes of philosopher Hans Reichenbach or biological statistician Sewall Wright into causal precedence and path analysis, and much more. The result is a new toolkit to identify causes and build causal explanations. Yet even as we get better at identifying causes, this raises new (or old) questions about causality, including metaphysical questions about the nature of causes (and effects, events, objects, etc), but also questions about what we really use causality for (understanding the world as it is or just to glean predictive control of specific outcomes), about how causality is used differently in different fields and activities (is cause in physics the same as that in history?), and about how other crucial concepts relate to our concept of cause (space and time seem to be related to causality, but so do concepts of legal and moral responsibility).

This course will introduce students to the mathematical formalism derived from Pearl's work, based on directed acyclic graphs and probability theory. Building upon previous work by Reichenbach and Wright, Pearl defines a "a calculus of interventions" of "do-calculus" for talking about interventions and their relation to causation and counterfactuals. This model has been applied in various areas ranging from econometrics to statistics, where acquiring knowledge about causality is of great importance.

At the same time, the course will not forget some of the metaphysical and epistemological issues around cause, so that students can better critically evaluate putative causal explanations in their full context. Abstractly, such issues involve some of the same philosophical questions Hume already asked, but more practically, it is important to see how metaphysical and epistemological debates surrounding the notion of cause affect scientific practice, and equally if not more importantly, how scientific practice pushes the limits of theory. This course will look at various ways in which empirical data can be transformed into explanations and theories, including the variance approach to causality (characteristic of the positivistic quantitative paradigm), and the process theory of causality (associated with qualitative methodology). Examples and case studies will be relevant for students of the social sciences but also students of the natural/physical world as well.

#### Intended Learning Outcomes

Students acquire transferable and key skills in this module.

By the end of this module, the students wil be able to

- 1. have a clear understanding of the history of causal thinking.
- 2. be able to form a critical understanding of the key debates and controversies surrounding the idea of causality.
- 3. be able to recognize and apply probabilistic causal models.
- 4. be able to explain how understanding of causality differs among different disciplines.
- 5. be able demonstrate how theoretical thinking about causality has shaped scientific practices.

Causation & Correlation					Duration 1 Semester	Workload 125 hours		

## **Content and Educational Aims**

There are no universal 'right skills'. But the notion of linear models and the avenue to matrices and their properties can be useful in diverse disciplines to implement a quantitative, computational approach. Some of the most popular data and systems analysis strategies are built upon this framework. Examples include principal component analysis (PCA), the optimization techniques used in Operations Research (OR), the assessment of stable and unstable states in nonlinear dynamical systems, as well as aspects of machine learning.

Here we introduce the toolbox of linear models and matrix-based methods embedded in a wide range of transdisciplinary applications (part 1). We describe its foundation in linear algebra (part 2) and the range of tools and methods derived from this conceptual framework (part 3). At the end of the course, we outline applications to graph theory and machine learning (part 4). Matrices can be useful representations of networks and of system of linear equations. They are also the core object of linear stability analysis, an approach used in nonlinear dynamics. Throughout the course, examples from neuroscience, social sciences, medicine, biology, physics, chemistry, and other fields are used to illustrate these methods.

A strong emphasis of the course is on the sensible usage of linear approaches in a nonlinear world. We will critically reflect the advantages as well as the disadvantages and limitations of this method. Guiding questions are: How appropriate is a linear approximation of a nonlinear system? What do you really learn from PCA? How reliable are the optimal states obtained via linear programming (LP) techniques?

This debate is embedded in a broader context: How does the choice of a mathematical technique confine your view on the system at hand? How, on the other hand, does it increase your capabilities of analyzing the system (due to software available for this technique, the ability to compare with findings from other fields built upon the same technique and the volume of knowledge about this technique)?

In the end, students will have a clearer understanding of linear models and matrix approaches in their own discipline, but they will also see the full transdisciplinarity of this topic. They will make better decisions in their choice of data analysis methods and become mindful of the challenges when going from a linear to a nonlinear thinking.

#### Intended Learning Outcomes

Upon completion of this module, students will be able to

- 1. apply the concept of linear modeling in their own discipline
- 2. distinguish between linear and nonlinear interpretation strategies and understand the range of applicability of linear models
- 3. make use of data analysis / data interpretation strategies from other disciplines, which are derived from linear algebra
- 4. be aware of the ties that linear models have to machine learning and network theory

Note that these four ILOs can be loosely associated with the four parts of the course indicated above

**Recommendations for Preparation** 

Please read: Camillus, J. (2008). Strategy as a wicked problem. Harvard Business Review 86: 99-106; Rogers, P. J. (2008). Using programme theory to evaluate complicated and complex aspects of interventions. Evaluation, 14, 29–48.

## **Content and Educational Aims**

Complex problems are, by definition, non-linear and/or emergent. Some fifty years ago, scholars such as Herbert Simon began to argue that societies around the world had developed an impressive array of tools with which to solve simple and even complicated problems, but still needed to develop methods with which to address the rapidly increasing number of complex issues. Since then, a variety of such methods has emerged. These include 'serious games' developed in computer science, 'multisector systems analysis' applied in civil and environmental engineering, 'robust decision-making' proposed by the RAND Corporation, 'design thinking' developed in engineering and business studies, 'structured problem solving' used by McKinsey & Co., 'real-time technology assessment' advocated in science and technology studies, and 'deliberative decision-making' emanating from political science.

In this course, students first learn to distinguish between simple, complicated and complex problems. They also become familiar with the ways in which a particular issue can sometimes shift from one category into another. In addition, the participants learn to apply several tools for resolving complex problems. Finally, the students are introduced to the various ways in which natural and social scientists can help stakeholders resolve complex problems. Throughout the course examples and applications will be used. When possible, guest lectures will be offered by experts on a particular tool for tackling complex issues. For the written, take-home exam, students will

have to select a specific complex problem, analyse it and come up with a recommendation – in addition to answering several questions about the material learned.

#### **Intended Learning Outcomes**

Upon completion of this module, students will be able to

- 1. Identify a complex problem;
- 2. Develop an acceptable recommendation for resolving complex problems.
- 3. Understand the roles that natural and social scientists can play in helping stakeholders resolve complex problems;

#### **Content and Educational aim**

One must be careful not to confuse argumentation with being argumentative. The latter is an unattractive personal attribute, whereas the former is a requirement of publicly holding a belief, asserting the truth of a proposition, the plausibility of a hypothesis, or a judgment of the value of a person or an asset. It is an essential component of public discourse. Public discourse is governed by norms and one of those norms is that those who assert the truth of a proposition or the validity of an argument or the responsibility of another for wrongdoing open themselves up to good faith requests to defend their claims. In its most general meaning, argumentation is the requirement that one offer evidence in support of the claims they make, as well as in defense of the judgments and assessments they reach. There are different modalities of argumentation associated with different contexts and disciplines. Legal arguments have a structure of their own as do assessments of medical conditions and moral character. In each case, there are differences in the kind of evidence that is thought relevant and, more importantly, in the standards of assessment for whether a case has been successfully made. Different modalities of argumentation require can call for different modes of reasoning. We not only offer reasons in defense of or in support of beliefs we have, judgments we make and hypotheses we offer, but we reason from evidence we collect to conclusions that are warranted by them.

Reasoning can be informal and sometimes even appear unstructured. When we recognize some reasoning as unstructured yet appropriate what we usually have in mind is that it is not linear. Most reasoning we are familiar with is linear in character. From A we infer B, and from A and B we infer C, which all together support our commitment to D. The same form of reasoning applies whether the evidence for A, B or C is direct or circumstantial. What changes in these cases is perhaps the weight we give to the evidence and thus the confidence we have in drawing inferences from it.

Especially in cases where reasoning can be supported by quantitative data, wherever quantitative data can be obtained either directly or by linear or nonlinear models, the visualization of the corresponding data can become key in both, reasoning and argumentation. A graphical representation can reduce the complexity of argumentation and is considered a must in effective scientific communication. Consequently, the course will also focus on smart and compelling ways for data visualization - in ways that go beyond what is typically taught in statistics or mathematics lectures. These tools are constantly developing, as a reflection of new software and changes in state of the presentation art. Which graph or bar chart to use best for which data, the use of colors to underline messages and arguments, but also the pitfalls when presenting data in a poor or even misleading manner. This will also help in readily identifying intentional misrepresentation of data by others, the simplest to recognize being truncating the ordinate of a graph in order to exaggerate trends. This frequently leads to false arguments, which can then be readily countered.

There are other modalities of reasoning that are not linear however. Instead they are coherentist. We argue for the plausibility of a claim sometimes by showing that it fits in with a set of other claims for which we have independent support. The fit is itself the reason that is supposed to provide confidence or grounds for believing the contested claim.

Other times, the nature of reasoning involves establishing not just the fit but the mutual support individual items in the evidentiary set provide for one another. This is the familiar idea of a web of interconnected, mutually supportive beliefs. In some cases, the support is in all instances strong; in others it is uniformly weak, but the set is very large; in other cases, the support provided each bit of evidence for the other is mixed: sometimes strong, sometimes weak, and so on.

There are three fundamental ideas that we want to extract from this segment of the course. These are (1) that argumentation is itself a requirement of being a researcher who claims to have made findings of one sort or another; (2) that there are different forms of appropriate argumentation for different domains and circumstances; and (3) that there are different forms of reasoning on behalf of various claims or from various bits of evidence to conclusions: whether those conclusions are value judgments, political beliefs, or scientific conclusions. Our goal is to familiarize you with all three of these deep ideas and to help you gain facility with each.

#### **Intended Learning Outcomes**

Students acquire transferable and key skills in this module.

By the end of this module, the students will be able to:

- 1. Distinguish among different modalities of argument, e.g. legal arguments, vs. scientific ones.
- 2. Construct arguments using tools of data visualization.
- 3. Communicate conclusions and arguments concisely, clearly and convincingly.

## Recommendations for Preparation

## **Content and Educational Aims**

Humans are a social species and interaction is crucial throughout the entire life span. While much of human communication involves language, there is a complex multichannel system of nonverbal communication that enriches linguistic content, provides context, and is also involved in structuring dynamic interaction. Interactants achieve goals by encoding information that is interpreted in the light of current context in transactions with others. This complexity implies also that there are frequent misunderstandings as a sender's intention is not fulfilled. Students in this course will learn to understand the structure of communication processes in a variety of formal and informal contexts. They will learn what constitutes challenges to achieving successful communication and to how to communicate effectively, taking the context and specific requirements for a target audience into consideration. These aspects will be discussed also in the scientific context, as well as business, and special cases, such as legal context – particularly with view to argumentation theory.

Communication is a truly transdisciplinary concept that involves knowledge from diverse fields such as biology, psychology, neuroscience, linguistics, sociology, philosophy, communication and information science. Students will learn what these different disciplines contribute to an understanding of communication and how theories from these fields can be applied in the real world. In the context of scientific communication, there will also be a focus on visual communication of data in different disciplines. Good practice examples will be contrasted with typical errors to facilitate successful communication also with view to the Bachelor's thesis.

### Intended Learning Outcomes

Upon completion of this module, students will be able to

- 1. Analyze communication processes in formal and informal contexts.
- 2. Identify challenges and failures in communication.
- 3. Design communications to achieve specified goals to specific target groups.
- 4. Understand the principles of argumentation theory.
- 5. Use data visualization in scientific communications.

## **Content and Educational Aims**

Each of us is judged by the actions we undertake and held to account for the consequences of them. Sometimes we may be lucky and our bad acts don't have harmful effects on others. Other times we may be unlucky and reasonable decisions can lead to unexpected or unforeseen adverse consequences for others. We are therefore held accountable both for choices and for outcomes. In either case, accountability expresses the judgment that we bear responsibility for what we do and what happens as a result. But our responsibility and our accountability in these cases is closely connected to the idea that we have agency.

Agency presumes that we are the source of the choices we make and the actions that result from those choices. For some, this may entail the idea that we have free will. But there is scientific world view that holds that all actions are determined by the causes that explain them, which is the idea that if we knew the causes of your decisions in advance, we would know the decision you would make even before you made it. If that is so, how can your choice be free? And if it is not free, how can you be responsible for it? And if you cannot be responsible, how can we justifiably hold you to account for it?

These questions express the centuries old questions about the relationship between free will and a determinist world view: for some, the conflict between a scientific world view and a moral world view.

But we do not always act as individuals. In society we organize ourselves into groups: e.g. tightly organized social groups, loosely organized market economies, political societies, companies, and more. These groups have structure. Some individuals are given the responsibility of leading the group and of exercising authority. But one can exercise authority over others in a group merely by giving orders and threatening punishment for non-compliance.

Exercising authority is not the same thing as being a leader? For one can lead by example or by encouraging others to exercise personal judgment and authority. What then is the essence of leadership?

The module has several educational goals. The first is for students to understand the difference between actions that we undertake for which we can reasonably held accountable and things that we do but which we are not responsible for. For example, a twitch is an example of the latter, but so too may be a car accident we cause as a result of a heart attack we

had no way of anticipating or controlling. This suggests the importance of control to responsibility. At the heart of personal agency is the idea of control. The second goal is for students to understand what having control means. Some think that the scientific view is that the world is deterministic, and if it is then we cannot have any personal control over what happens, including what we do. Others think that the quantum scientific view entails a degree of indeterminacy and that free will and control are possible, but only in the sense of being unpredictable or random. But then random outcomes are not ones we control either. So, we will devote most attention to trying to understand the relationships between control, causation and predictability.

But we do not only exercise agency in isolation. Sometimes we act as part of groups and organizations. The law often recognizes ways in which groups and organizations can have rights, but is there a way in which we can understand how groups have responsibility for outcomes that they should be accountable for. We need to figure out then whether there is a notion of group agency that does not simply boil down to the sum of individual actions. We will explore the ways in which individual actions lead to collective agency.

Finally we will explore the ways in which occupying a leadership role can make one accountable for the actions of others over which one has authority.

#### **Intended Learning Outcomes**

Students acquire transferable and key skills in this module.

By the end of this module, the students will be able to

- 1. understand and reflect how the social and moral world views that rely on agency and responsibility are compatible, if they are, with current scientific world views.
- 2. understand how science is an economic sector, populated by large powerful organizations that set norms and fund research agendas.
- 3. identify the difference between being a leader of others or of a group whether a research group or a lab or a company and being in charge of the group.
- 4. learn to be a leader of others and groups. Understand that when one graduates one will enter not just a field of work but a heavily structured set of institutions and that one's agency and responsibility for what happens, what work gets done, its quality and value, will be affected accordingly.

		disciplines	Duration	Workload				
			1 semester	125 hours				

## **Recommendations for Preparation**

Develop or join a community impact project before the 5<sup>th</sup> or 6<sup>th</sup> semester based on the introductory events during the 4<sup>th</sup> semester by using the database of projects, communicating with fellow students and faculty, and finding potential companies, organizations, or communities to target.

## **Content and Educational Aims**

CIPs are self-organized, major-related, and problem-centered applications of students' acquired knowledge and skills. These activities will ideally be connected to their majors so that they will challenge the students' sense of practical relevance and social responsibility within the field of their studies. Projects will tackle real issues in their direct and/or broader social environment. These projects ideally connect the campus community to other communities, companies, or organizations in a mutually beneficial way.

Students are encouraged to create their own projects and find partners (e.g., companies, schools, NGOs), but will get help from the CIP faculty coordinator team and faculty mentors to do so. They can join and collaborate in interdisciplinary groups that attack a given issue from different disciplinary perspectives.

Student activities are self-organized but can draw on the support and guidance of both faculty and the CIP faculty coordinator team.

#### Intended Learning Outcomes

The Community Impact Project is designed to convey the required personal and social competencies for enabling students to finish their studies at Constructor as socially conscious and responsible graduates (part of the Constructor mission) and to convey social and personal abilities to the students, including a practical awareness of the societal context and relevance of their academic discipline.

By the end of this project, students will be able to

- understand the real-life issues of communities, organizations, and industries and relate them to concepts in their own discipline;
- enhance problem-solving skills and develop critical faculty, create solutions to problems, and communicate these solutions appropriately to their audience;

- apply media and communication skills in diverse and non-peer social contexts;
- develop an awareness of the societal relevance of their own scientific actions and a sense of social responsibility for their social surroundings;
- reflect on their own behavior critically in relation to social expectations and consequences;
- work in a team and deal with diversity, develop cooperation and conflict skills, and strengthen their empathy
  and tolerance for ambiguity.

#### **Indicative Literature**

## Usability and Relationship to other Modules

## Content and Educational Aims

The nature of morality – how to lead a life that is good for yourself, and how to be good towards others – has been a central debate in philosophy since the time of Socrates, and it is a topic that continues to be vigorously discussed. This course will introduce students to some of the key aspects of philosophical ethics, including leading normative theories of ethics (e.g. consequentialism or utilitarianism, deontology, virtue ethics, natural law ethics, egoism) as well as some important questions from metaethics (are useful and generalizable ethical claims even possible; what do ethical speech and ethical judgements actually do or explain) and moral psychology (how do abstract ethical principles do when realized by human psychologies). The course will describe ideas that are key factors in ethics (free will, happiness, responsibility, good, evil, religion, rights) and indicate various routes to progress in understanding ethics, as well as some of their difficulties.

### Intended Learning Outcomes

Upon completion of this module, students will be able to

- 1. Describe normative ethical theories such as consequentialism, deontology and virtue ethics.
- 2. Discuss some metaethical concerns.
- 3. Analyze ethical language.
- 4. Highlight complexities and contradictions in typical ethical commitments.
- 5. Indicate common parameters for ethical discussions at individual and social levels.
- 6. Analyze notions such as objectivity, subjectivity, universality, pluralism, value.

Intended Learning	Outcomes								

Upon completion of this module, students will be able to

- 1. Understand key ideas from the philosophy of science.
- Discuss different types of inference and rational processes.
   Describe differences between how the natural sciences, social sciences and humanities discover knowledge.
- 4. Identify ways in which science can be more and less value-laden.
- 5. Illustrate some important conceptual leaps in the history of science.

#### Content and Educational Aims

Of the five senses, the sense of sight has for a long time occupied the central position in human cultures. As John Berger has suggested this could be because we can see and recognize the world around us before we learn how to speak. Images have been with us since the earliest days of the human history. In fact, the earliest records of human history are images found on cave walls across the world. We use images to capture abstract ideas, to catalogue and organize the world, to represent the world, to capture specific moments, to trace time and change, to tell stories, to express feelings, to better understand, to provide evidence and more. At the same time, images exert their power on us, seducing us into believing in their 'innocence', that is into forgetting that as representations they are also interpretations, i.e., a particular version of the world.

The purpose of this course is to explore multiple ways in which images and the visual in general mediate and structure human experiences and practices from more specialized discourses, e.g., scientific discourses, to more informal and personal day-to-day practices, such as self-fashioning in cyberspace. We will look at how social and historical contexts affect how we see, as well as what is visible and what is not. We will explore the centrality of the visual to the intellectual activity, from early genres of scientific drawing to visualizations of big data. We will examine whether one can speak of visual culture of protest, look at the relationship between looking and subjectivity and, most importantly, ponder the relationship between the visual and the real.

#### **Intended Learning Outcomes**

Upon completion of this module, students will be able to

- 1. Understand a range of key concepts pertaining to visual culture, art theory and cultural analysis
- 2. Understand the role visuality plays in development and maintenance of political, social, and intellectual discourses
- 3. Think critically about images and their contexts
- 4. Reflect critically on the connection between seeing and knowing
