
Data Engineering

Master of Science

Subject-specific Examination Regulations for Data Engineering

The subject-specific examination regulations for Data Engineering are defined by this program handbook and are valid only in combination with the General Examination Regulations for Master degree programs ("General Master Policies").

This handbook also contains the program-specific Study and Examination Plan in chapter 2.2

Upon graduation students in this program will receive a Master of Science (MSc) degree with a scope of 120 ECTS credit points (for specifics see chapter 2 of this handbook).

Valid for all students starting their studies in Fall 2024

Study Program Chair: Prof. Dr. Stefan Kettemann

Professor for Complex Systems

Contents

1 Program Overview

Today we are “drowning in data and starving for information”, while acknowledging that “data is the new gold”. However, deriving value from all the data now available requires a transformation in data analysis, in how we see, maintain, share and understand data. Data Engineering is an emerging profession concerned with the task of acquiring large collections of data and extracting insights from them. It is driving the next generation of technological innovation and scientific discovery, which is expected to be strongly data-driven.

The graduate program in Data Engineering offers a fascinating and profound insight into the methods and technologies of this rapidly growing area. The program combines the big data aspects of “Data Analytics” as well as of “Data Science” with the technological challenges of data acquisition, curation, and management. Thus, the program provides the essentials for paving the way to a successful career: computer skills and mathematical understanding paired with practical experience in selected application fields.

The program is embedded into the School of Computer Science & Engineering at Constructor University. Even though the Data Engineering program is centered in the School of Computer Science & Engineering, it includes contributions from and supports applications in the two other research schools: The School of Science (bioactive substances), and the School of Business, Social & Decision Sciences (in modern societies).

Moreover, the Data Engineering program attracts students with diverse career goals, backgrounds, and prior work experience. Therefore, the program offers four focus tracks within which the students can choose to specialize further: Computer Science, Geo-Informatics, Bio-Informatics and Business & Supply Chain Engineering. These tracks are a preparation for the Advanced Projects within the Discovery Area and the Master Thesis.

In particular, one specialization track is Computer Science providing them the skills to go beyond a mere usage of existing toolboxes, and develop innovative data analysis techniques of their own design.

Another specialization track is Bioinformatics and the analysis of biomedical data. Integration and model-based interpretation of high-throughput data are severe bottlenecks in biomedical and pharmaceutical research. Data Engineering prepares students for the novel computational challenges in these fields.

A third specialization track is Geo-Informatics which introduces Geographic Information System techniques, principles of spatial analysis, and data mining with integration of remote sensing and GPS. It thereby provides an early exposure to earth science data and its handling.

Students can also choose the specialization track of Business & Supply Chain Engineering. A vast amount of data is collected as part of business processes in particular along supply chains. In this specialization track students will concentrate on the full data analysis cycle including pre-processing of data, data analysis and deployment of model results within the business process.

The graduate program in Data Engineering is tailored to a diverse student body (see also Section 1.3) with a wide variety of interests, academic backgrounds, and previous experiences. Small group sizes, a low student-to-teacher ratio, and personalized supervision/advising allow the program to cater to the 21-year-old student who has just graduated with a Bachelor degree, as well as a person who already has been employed in a data-intensive company and who wants to keep up with current data engineering practices.

1.1 Qualification Aims

1.1.1 Educational Aims

The program aims to provide an in-depth understanding of the essential aspects of data-based decision-making and the skills required to apply and implement these powerful methods in a successful and responsible manner. Apart from the necessary programming skills, this comprises:

- methods of data acquisition both from the internet and from sensors;
- methods to efficiently store and access data in large and distributed data bases;
- statistical model building including a wide range of data mining methods, signal processing, and machine learning techniques;
- visualization of relevant information;
- construction and use of confidence intervals, hypothesis testing, and sensitivity analyses;
- the legal foundations of Data Engineering;
- scientific qualification;
- competence to take up qualified employment in Data Engineering;
- competence for responsible involvement in society;
- personal growth.

1.1.2 Intended Learning Outcomes

Upon completion of this program, students will be able to

1. critically assess and creatively apply technological possibilities and innovations driven by big data;
2. use sensors and microcontrollers to collect data and to transmit them to databases on servers or the internet in general;
3. set up and use databases to efficiently and securely manage and access large amounts of data;
4. apply statistical concepts and use statistical models in the context of real-life data analytics;
5. use, adapt and improve visualization techniques to support data-based decision-making;
6. design, implement and exploit various representations of data for classification and regression including supervised machine learning methods and core ideas of deep learning;
7. apply and critically assess data acquisition methods and analytical techniques in real life situations, organizations and industries;
8. independently investigate complex problems and undertake scientific or applied research into a specialist area utilizing appropriate methods, also taking methods and insights of other disciplines into account;
9. professionally communicate their conclusions and recommendations, the underlying information and their reasons to both specialists and non-specialists, clearly and unambiguously on the basis of the state of research and application;
10. assess and communicate social, scientific and ethical insights that also derive from the application of their knowledge and their decisions;
11. engage ethically with the academic, professional and wider communities and actively contribute to a sustainable future;
12. take responsibility for their own learning, personal development, and role in society, evaluating critical feedback and self-analysis;
13. take on lead responsibility in a diverse team;
14. adhere to and defend ethical, scientific and professional standards.

1.2 Target Audience

The Data Engineering graduate program is targeted towards students who have completed their BSc in areas such as computer science, physics, applied mathematics, statistics, electrical engineering, communications engineering or related disciplines, and who want to deepen their knowledge and proceed to research-oriented work towards a master or ultimately a PhD degree. Typical examples are:

- a bachelor in computer science who wants to acquire skills in data analysis and micro/macroeconomics for a career in computational finances;
- a bachelor in business with a solid statistics and analysis foundation and programming experience;
- a bachelor in geology who wants to become a data scientist and needs to deepen his/her mathematical and statistical skills;
- a student with a bachelor or master degree in one of the natural sciences who wishes to boost his/her career in empirical research or industrial research and development, where professional handling of very large-scale data collections has become a prime bottleneck for success;
- a bachelor in mathematics or physics who wants to capitalize on his/her theoretical knowledge of modeling methods by learning about the hands-on side of data analysis, interesting fields for applications, and options for employment;
- a student with an undergraduate degree in the life sciences wishing to expand their skill sets towards computational methods and to specialize in bioinformatics and the analysis of biomedical data.

In order to facilitate the integration of students with diverse backgrounds, we offer remedial courses in the first semester. Placement tests in the orientation week before the beginning of the first semester help students to identify contents that they need to refresh or remedy.

1.3 Career Options and Support

The demand for Data Engineers is massive. Typical fields of work encompass the finance sector, the automotive and health industry as well as retail and telecommunications. Companies and institutions in almost every domain need:

- experts for data acquisition who find out how to collect the data needed;
- experts for data management who know how to store, enhance, protect and process large amounts of data efficiently;
- experts for data analysis who evaluate and interpret the collected data correctly and are able to visualize the findings clearly.
- Graduates of the program work as data analysts, data managers, data architects, business consultants, software and web developers, or system administrators;
- an MSc degree in Data Engineering also allows students to move on to a PhD and a career in academia and research institutions.

The employability of Data Engineering graduates is promoted by organizing contacts with industry and research institutes throughout the curriculum. In the first semester, in the Current Topics in Data Engineering seminar, companies and research groups introduce their field of interest. The advanced projects, in the second and third semesters can be combined with internships in research institutes or companies. In the second and third semester, the participation in public big data challenges is organized as an integral part of the curriculum.

The Career Service Center (CSC) helps students in their career development. It provides students with high-quality training and coaching in CV creation, cover letter formulation, interview preparation, effective

presenting, business etiquette, and employer research as well as in many other aspects, thus helping students identify and follow up on rewarding careers after graduating from Constructor University. For further information, please contact the Career Service Center (CSC) (https://constructor.university/student-life/career-services). Furthermore, the Alumni Office helps students establish a long-lasting and worldwide network which provides support when exploring job options in academia, industry, and elsewhere.

1.4 Admission Requirements

The Data Engineering graduate program requires students to have completed their undergraduate program in computer science, physics, applied mathematics, statistics, electrical engineering, communications engineering or related disciplines.

Admission to Constructor University is selective and based on a candidate's university achievements, recommendations and self-presentation. Students admitted to Constructor University demonstrate exceptional academic achievements, intellectual creativity, and the desire and motivation to make a difference in the world.

The following documents need to be submitted with the application:

- Letter of motivation
- Curriculum vitae (CV)
- Official or certified copies of university transcripts
- Bachelor's degree certificate or equivalent
- Language proficiency test results (minimum score of 90 (TOEFL), 6.5 (IELTS) or 110 (Duolingo)).
- Copy of Passport
- Letter of recommendation (optional).

Formal admission requirements are subject to higher education law and are outlined in the Admission and Enrollment Policy of Constructor University.

For more detailed information about the admission visit:

https://constructor.university/admission-aid/application-information-graduate

2 The Curriculum

2.1 The Curriculum at a Glance

The Data Engineering graduate program is composed of foundational lectures, specialized modules, industry seminars and applied project work, leading to a master thesis that can be conducted in research groups at Constructor University, at external research institutes or in close collaboration with a company. The program takes four semesters (two years). The following table shows an overview of the modular structure of the program. The program is sectioned into five areas (Core, Elective, Methods, Discovery, and Career) and the Master Thesis. All credit points (CP) are ECTS (European Credit Transfer System) credit points. In order to graduate, students need to obtain 120 CP. See Chapter 3 “Modules” of this handbook for the detailed module descriptions or refer to CampusNet.

Figure 2: Study and Examination Plan

2.3 Core Area (30 CP)

This area is the centerpiece of the Data Engineering program. The six mandatory modules in the Core Area cover essential methods of data engineering. They provide the foundations for further, more advanced courses and applied projects by introducing the fundamental concepts, methods and technologies used in data engineering. The modules are intensive courses accompanied by hands-on tutorials and labs.

To pursue a DE master, the following Core modules (15 CP) need to be taken as mandatory modules (m):

- CORE Module: The Big Data Challenge (m, 5 CP)
- CORE Module: Data Analytics (m, 5 CP)
- CORE Module: Machine Learning (m, 5 CP)
- CORE Module: Data Security and Privacy (m, 5 CP)
- CORE Module: IT Law (m, 5 CP)
- CORE Module: Image Processing for Data Engineers (m, 5 CP)
- CORE Module: Data Acquisition Technologies and Sensor Networks (m, 5 CP)

2.4 Elective Area (15 CP)

The Data Engineering program attracts students with diverse career goals, backgrounds, and prior work experience. Therefore, modules in this area can be chosen freely by students depending on their prior knowledge and interests. Students can choose to strengthen their knowledge by following one of four suggested focus tracks and electing the modules offered therein: Computer Science, Geo-Informatics, Bio-Informatics and Business & Supply Chain Engineering. These tracks are a preparation for the Advanced Projects within the Discovery Area and the Master Thesis.

Students may choose any combination of the modules listed below. Each track may be followed completely and/or complemented with other modules (as necessary in case of the tracks with 10 CP). In addition to the modules offered within these focus tracks, 3rd year modules from the undergraduate curriculum or other graduate programs at Constructor University can be taken with the approval of the program coordinator. Please see CampusNet for current offerings.

To enhance flexibility, students may transfer modules between the Elective and the Methods Areas (except for remedial modules) after consulting their academic advisor.

The following mandatory elective (me) modules are part of the Computer Science Track:

- Computer Science Elective Module: Principles of Statistical Modeling (me, 5 CP)
- Computer Science Elective Module: Advanced Data Bases (me, 5 CP)
- Computer Science Elective Module: Network Theory (me, 5 CP)
- Computer Science Elective Module: Parallel and Distributed Computing (me, 5 CP)

The following mandatory elective (me) modules are part of the Geo-Informatics Track:

- Geo-Informatics Elective Module: Geo Informatics (me, 5 CP)
- Geo-Informatics Elective Module: Geo Informatics Lab (me, 5 CP)

The following mandatory elective (me) modules are part of the Bio-Informatics Track:

- Bio-Informatics Elective Module: Modeling and Analysis of Complex Systems (me, 5 CP)
- Bio-Informatics Elective Module: Computational Approach in Biology and Medicine (me, 5 CP)
- Bio-Informatics Elective Module: Management and Analysis of Biological and Medical Data (me, 5 CP)

The following mandatory elective (me) modules are part of the Business & Supply Chain Engineering Track:

- Business & Supply Chain Engineering Elective Module: Data Mining (me, 5 CP)
- Business & Supply Chain Engineering Elective Module: Data Analytics in Supply Chain Management (5 CP)

2.5 Methods Area (15 CP)

In the Methods Area advanced concepts, methods and technologies of data engineering are introduced with a view towards industrial applications. Students can choose freely from the modules in this area. To enhance flexibility, students may transfer modules between the Elective and the Methods Areas (except for remedial modules) after consulting their academic advisor.

Students need to take the following mandatory (m) modules in the Methods area:

- Methods Module: Introduction to Data Management with Python (m, 5 CP)

Further, the following mandatory elective (me) modules are part of the Methods area:

- Methods Module: Modeling and Control of Dynamical Systems (me, 5 CP)
- Methods Module: Modern Signal Processing (me, 5 CP, offered biennially)
- Methods Module: Network Approaches in Biology and Medicine (me, 5 CP)
- Methods Module: Applied Dynamical Systems (me, 5 CP, offered biennially)

Within the Methods Area Constructor University offers special remedial modules, which are recommended to refresh knowledge or to fill knowledge gaps, preparing students to successfully take the Data Engineering Core Area modules. Based on a placement test in the orientation week, the academic advisor will propose which of the modules are useful depending on prior knowledge of the student.

The remedial modules in the Methods area are as follows:

- Remedial Module: Calculus and Linear Algebra for Graduate Students (me, 5 CP)
- Remedial Module: Probabilities for Graduate Students (me, 5 CP)

2.6 Discovery Area (15 CP)

This area features in the first semester a Project Seminar introducing the students to Current Topics and Challenges in Data Engineering, which is followed by two advanced projects in Data Engineering in semesters 2 and 3, each of which is worth 5 CP. The projects can be done in the research groups at Constructor University or during internships at companies. The projects are supervised by Constructor University faculty.

The following modules are mandatory (m) and part of the Discovery area:

- Discovery Module: Current Topics in Data Engineering (m, 5 CP)
- Discovery Module: Data Engineering Advanced Project I (m, 5 CP)
- Discovery Module: Data Engineering Advanced Project II (m, 5 CP)

2.7 Career Area (15 CP)

In this area students acquire skills to prepare them for a career as data engineers in industry.

The following modules are mandatory (m) for the career area:

- Career Module: Language skills (m, 3 x 2.5 CP = 7.5 CP)
- Career Module: Communication & Presentation Skills for Executives (m, 2.5 CP)
- Career Module: Academic Writing Skills / Intercultural Training (m, 2.5 CP)
- Career Module: Ethics and the Information Revolution (m, 2.5 CP)

2.8 Master Thesis (30 CP)

In the fourth semester, students conduct research and write a mandatory master thesis guided and supported by their academic advisor, worth of 30 credit points.

- Thesis Module: Master Thesis (m, 30 CP)

<tr><td colspan="6">Content and Educational Aims

Big data is one of the buzz words of the current decade and refers to the collection and exploration of complex data sets. This complexity of big data is typically described by the four V's: Volume, Velocity, Variety, and Veracity. From a business perspective, big data is often portrayed as a sea of big opportunities. The public debate is torn between the two poles portrayed by the writers George Orwell and Aldous Huxley: complete surveillance resulting in oppression on the one end, and irrelevance and narcissism on the other. Technological research quite naturally is mostly concerned with the technical feasibility of different approaches, the continuously increasing challenges with respect to the four V's, and the creative solutions needed to tackle them.
In this module students receive an overview of big data by looking at it from various perspectives, primarily the business and societal points of view. The focus is not on the technical methods and skills, but on case studies that show big data and data engineering in a cross-section.</td></tr>
</table>

Intended Learning Outcomes

Upon completion of this module, students will be able to

1. contribute knowledgeably to the current debate about big data, digitalization and industry 4.0;
2. explain and discuss pros and cons of digitalization from a business perspective as well as a societal perspective;
3. perform a SWOT analysis on current big data initiatives;
4. evaluate technological possibilities and innovations driven by big data;
5. assess the business opportunities of current big data developments.

Z. Lv, H. Song, P. Basanta-Val, A. Steed and M. Jo. "Next-Generation Big Data Analytics: State of the Art, Challenges, and Future Research Topics," in IEEE Transactions on Industrial Informatics, vol. 13, no. 4, pp. 1891-1899, Aug. 2017.

Usability and Relationship to other Modules

- For DE: This module provides an overview on practical big data applications. The computational details will then be studied in MDE-CS-04.
- For SCM: Concepts are applied in MSCM-CO-03 Trends & Challenges in Supply Chain Management. Project management concepts taught in MSCM-CO-01 will be applied. Academic writing skills taught in MSCM-CAR-01 facilitate the completion of the tasks in this module.

Examination Type: Module Examination

Assessment Type: Project Report Length: 2.500 words
Weight: 100%

Scope: All intended learning outcomes of this module.
Completion: to pass this module, the examination has to be passed with at least 45%.

<tr><td colspan="6">Content and Educational Aims

Digital information, the Internet, and applications like YouTube or social networking tools like Instagram, Facebook, or Twitter have disrupted legal systems (Murray 2016). IT law is not limited to one legal area but encompasses civil, public, and criminal laws. It spans from human rights law to intellectual property law, contract and consumer protection law, privacy law, data protection law, and other legal domains. Moreover, the global exchange of data is in conflict with the territorial principle of jurisdiction. In addition, IT regulations are in a constant flux to keep up with the accelerated pace of technological progress. This module looks into the most important areas of IT law. It provides the participants with a sound understanding of legal principles and regulations, and sheds light on international as well as European ICT policies and governance. A special focus will be given to the European General Data Protection Regulation (GDPR).</td></tr>
<tr><td colspan="6">Intended Learning Outcomes

By the end of this module, students will be able to
1. identify legal questions and implications in relation to digital transformation technologies/IT law/ AI and algorithms
2. understand fundamental national and international legal frameworks related to the use of data
3. know the relevant IP rights regarding data and algorithms
4. understand and critically assess legal regulations about data privacy and data protection
5. recognize and explain the types of bias inherent in data processing
6. explain the legal concerns related to data-based automatic decision making
7. understand how to comply to the GDPR and assess its impact on individuals, firms, and organizations
8. understand and critically evaluate the liabilities and available remedies with regard to data
9. explain and develop potential future IT regulation mechanisms</td></tr>

<tr><td colspan="6">Content and Educational Aims

This module introduces concepts and methods of data analytics. The objective of the module is to present methods for gaining insight from data and drawing conclusions for analytical reasoning and decision-making. The module comprises a broad spectrum of methods for modelling and understanding complex datasets. Comprising both descriptive and predictive analytics, the standard portfolio of supervised and unsupervised learning techniques is introduced. Automatic analysis components, such as data transformation, aggregation, classification, clustering, and outlier detection, will be treated as an integral part of the analytics process.
As a central part of this module, students are introduced to the major concepts of statistical learning such as cross-validation, feature selection, and model evaluation. The course takes an applied approach and combines the theoretical foundation of data analytics with a practical exposure to the data analysis process.</td></tr>
<tr><td colspan="6">Intended Learning Outcomes

By the end of this module, students will be able to

1. explain advanced data analytics techniques in theory and application;
2. apply data analytics methods to real-life problems using appropriate tools;
3. evaluate and compare different data analytics algorithms and approaches;
4. apply statistical concepts to evaluate data analytics results.</td></tr>

Read the syllabus.
Highly recommended: Mitchell, Tom M.: Machine Learning (McGraw-Hill, 1997) IRC: Q325.5.M58 1997. This standard, classical textbook gives a very accessible overview of ML.</td></tr>
<tr><td colspan="6">Content and Educational Aims

Machine learning (ML) is a module that concerns algorithms that are fed with (large quantities of) real-world data, and which return a compressed "model" of the data. An example is the "world model" of a robot: the input data are sensor data streams, from which the robot learns a model of its environment. Another example is a spoken language model: the input data are speech recordings, from which ML methods build a model of spoken English -- useful, for instance, in automated speech recognition systems. There are many formalisms in which such models can be cast, and an equally large diversity of learning algorithms. At the same time, there is a relatively small number of fundamental challenges that are common to all of these formalisms and algorithms.

The module introduces such fundamental concepts and illustrates them with a choice of elementary model formalisms (linear classifiers and regressors, radial basis function networks, clustering, neural networks). Furthermore, the module also (re)introduces required mathematical material from probability theory and linear algebra. The main educational aims are twofold: to make students fully aware of the two main hurdles for obtaining good models from data: (i) the "curse of dimensionality" and (ii) the bias-variance dilemma and to provide standard tools to cope with these difficulties, namely (i') dimension reduction by feature extraction, for example via PCA or clustering, and (ii') cross-validation and regularization.</td></tr>
<tr><td colspan="6">Intended Learning Outcomes

Upon completion of this module, students will be able to

1. design, implement and exploit elementary supervised ML methods for classification and regression with expert care given to dimension reduction preprocessing and regularization;
2. understand and practically use PCA and linear regression;</td></tr>
</table>

3. understand the core ideas behind feedforward neural networks and the backpropagation algorithm, as the basis for accessing "deep learning" methods.

Indicative Literature

T. M. Mitchel, Machine Learning, McGraw-Hill, 1997, IRC: Q325.5.M58.

Usability and Relationship to other Modules

This module is a natural companion to the "Principles of Statistical Modeling" (PSM) module MDE-CS-03.
The ML module focuses on practical ML skills, whereas PSM module on rigorous mathematical formalism and analysis.
For students not familiar with graph theory, it is recommended to take the first semester course MDE-CS-01 Network Theory, which introduces concepts used in this Machine Learning module.

Examination Type: Module Examination

Assessment Type: Written examination — Duration: 120 minutes

<tr><td colspan="6">Content and Educational Aims

This course introduces the basic concepts and applications of image processing for data engineers. This module's aim is to enable students:

• To transform images using different methods,
• To work with digital images conceived of as two-or higher-dimensional signals,
• And to perform operations on them to extract useful information.

This course introduces sampling and quantization strategies, elementary image transformations, and higher-level information extraction techniques like noise reduction, image segmentation, and feature extraction leading up to image analysis automation.

The module will be taught along real-world applications relevant for data engineers, such as in biomedical imaging, pattern recognition and classification. It will provide an overview of the broader field of image processing. Homework assignments will cover Python implementations of basic and combined image processing algorithms.</td></tr>
<tr><td colspan="6">Intended Learning Outcomes

Upon completion of this module, students will be able to

1. explain the theory and concepts of image processing
2. apply sampling and quantization strategies, image segmentation, image transformations, noise reduction and feature extraction to 2D images
3. design and implement their own image processing algorithms in Python and apply these to real world examples.</td></tr>

Recommendations for Preparation

Read the syllabus.
A lab manual will be provided, reading the lab manual before each lab session is recommended.

Content and Educational Aims

Medical monitoring, smart cars, smart grids, smart homes, and ubiquitous connections to the internet everywhere: There will be an ocean of data not only entered by humans but also automatically pouring in from billions of sensors deployed in a plethora of devices. How are such data collected, and how can they be made available to you, to your doctor, or to other users? These are only some of the questions to be addressed. This module offers a hands-on introduction to the technology behind the scenes. Topics include microcontrollers; how to program them; the way they interact with sensors and actuators; and the wireless techniques they use to communicate with each other, with other computers, and with the internet.

As the module covers a wide range of platforms, it also utilizes aspects from a variety of different languages and devices. To be successful, it helps to be familiar with basic electrical circuits, microcontrollers, HTML, PHP, SQL, C, and Python. Although there will be a lot of support, it is recommended to be familiar with at least a few of these aspects.

Intended Learning Outcomes

Upon completion of this module, students will be able to

1. acquire data from different sensors and use a microcontroller to process them;
2. transmit data from the microcontroller to a database on a server
3. collect data from web browsers and transmit them to a database on a server
4. visualize the data on computers or smart devices
5. set up a wireless sensor network and communicate data among different components.

Workload

125 hours</td></tr>
<tr><td colspan="6">Recommendations for Preparation

Read the syllabus.</td></tr>
<tr><td colspan="6">Content and Educational Aims

This module introduces the basic concepts of statistical modeling. The focus is on a thorough understanding of fundamental concepts: the nature of probability spaces and random variables; distributions and their representations; design and critical assessment of real-life samples; statistical hypothesis testing; statistical decision-making; strategies for estimator design. This module is distinguished from standard probability courses for non-mathematical audiences in that the mathematical model of „probability" is rigorously introduced, including sigma-fields.

The primary educational aim is to lift students to a level of mastery and understanding of the intricate formalism of probability and statistics that enables them to read the respective scientific literature and to adapt existing algorithms or even develop new algorithms. This module is thus targeted at students who want to go beyond a mere mechanical use of existing statistical toolboxes, and develop innovative data analysis techniques of their own design.

The secondary educational aims are to enable students to (i) understand the substantial differences between methodological approaches and fundamental mindsets in statistics vs. machine learning and (ii) understand the differences between and respective advantages and disadvantages of classical frequentist vs. Bayesian modeling methods.</td></tr>
</table>

Intended Learning Outcomes

Upon completion of this module, students will be able to

1. correctly and insightfully use the core formalism of probability theory;
2. understand the (basic) formalism used in the scientific literature of machine learning and statistics;
3. decide which type of approach is indicated to address a given modeling task (frequentist vs. Bayesian; black-box-modeling in machine learning spirit vs. statistical decision procedures; maximum-likelihood vs. Bayesian vs. unbiasedness criteria for procedure selection);
4. appreciate the importance of being exact and circumspective in setting up statistical modeling procedures.

<tr><td colspan="6">Content and Educational Aims

The theory of networks - as diverse as power grids, computer networks, social networks, and biological networks - has emerged in recent years as a highly dynamic and rapidly developing discipline. The study of networks is broadly interdisciplinary and important developments have occurred in many fields, including mathematics, physics, computer and information sciences, biology, and the social sciences. This module introduces this field, starting with a review of the diverse realizations of networks. We then teach how to measure the structure of networks and introduce methods for analyzing network data.

We introduce graph theory, which forms the basis of network theory. Then, we review computer algorithms and spectral methods to analyze networks. We introduce various mathematical models of networks, including random graph models and generative models, and conclude with more recent theories that model the dynamical processes taking place on networks.</td></tr>
<tr><td colspan="6">Intended Learning Outcomes

Upon completion of this module, students will be able to

1. measure structure of networks;
2. analyze network data;
3. perform the modeling of dynamic processes on networks;
4. communicate in scientific language using advanced field-specific technical terms.</td></tr>

<tr><td colspan="6">Content and Educational Aims

In the recent years, the development of parallel and cloud computing has opened the door for Big Data analysis and processing. This module aims at providing an overview and introduction to the vast field of parallel and cloud computing. In traditional parallel computing, we aim to develop notions for different parallelization models (shared- memory, distributed -memory, SIMD, SIMT), get to know appropriate programming methodologies for high performance data analysis (OpenMP / MPI) and aim at understanding performance and scalability in this field (weak vs. strong scaling, Amdahl's law).This fundamental knowledge will then be carried over to recent developments in cloud computing, where distributed processing frameworks (Spark / Hadoop MapReduce / Dask), based on appropriated deployment infrastructures, are in the process to become De Facto standards for Big Data processing and analysis. We will approach these technologies from a practical point of view and aim at developing the necessary knowledge to carry out scalable machine learning and data processing on Big Data.</td></tr>
<tr><td colspan="6">Intended Learning Outcomes

By the end of this module, students will be able to

1. understand theory and fundamentals of parallelization models (shared-/distributed memory, SIMD, SIMT)
2. explain and apply parallel programming methodologies (OpenMP / MPI)
3. describe and analyze performance and scalability (weak vs. strong scaling, ...)
4. Understand basic principles of distributed and cloud computing
5. use distributed processing frameworks (Spark / Hadoop MapReduce / Dask) for scalable distributed calculations
6. develop scalable machine learning and data processing on Big Data</td></tr>

<tr><td colspan="6">Content and Educational Aims

Machine learning (ML) is a module that concerns algorithms that are fed with (large quantities of) real-world data, and which return a compressed "model" of the data. An example is the "world model" of a robot: the input data are sensor data streams, from which the robot learns a model of its environment. Another example is a spoken language model: the input data are speech recordings, from which ML methods build a model of spoken English -- useful, for instance, in automated speech recognition systems. There are many formalisms in which such models can be cast, and an equally large diversity of learning algorithms. At the same time, there is a relatively small number of fundamental challenges that are common to all of these formalisms and algorithms.
The module introduces such fundamental concepts and illustrates them with a choice of elementary model formalisms (linear classifiers and regressors, radial basis function networks, clustering, neural networks). Furthermore, the module also (re) introduces required mathematical material from probability theory and linear algebra. The main educational aims are twofold: to make students fully aware of the two main hurdles for obtaining good models from data: (i) the "curse of dimensionality" and (ii) the bias-variance dilemma and to provide standard tools to cope with these difficulties, namely (i') dimension reduction by feature extraction, for example via PCA or clustering, and (ii') cross-validation and regularization.</td></tr>
<tr><td colspan="6">Intended Learning Outcomes

By the end of this module, students will be able to</td></tr>
</table>

1. design, implement and exploit elementary supervised ML methods for classification and regression with expert care given to dimension reduction preprocessing and regularization;
2. understand and practically use PCA and linear regression;
3. understand the core ideas behind feedforward neural networks and the backpropagation algorithm, as the basis for accessing "deep learning" methods.

Indicative Literature

The course is based on a self-contained, detailed set of online lecture notes.

Nevertheless, the following provides a good overview of the material covered:

P. A. Longley, M. F. Goodchild, D. J. Maguire, D. W. Rhind, Geographic Information Systems and Science, 2nd Edition, Wiley, 2005, 560 p. ISBN 0470721448.

Jake VanderPlas, Python Data Science Handbook, 2016, https://jakevdp.github.io/PythonDataScienceHandbook/.

Usability and Relationship to other Modules

- This module is a natural companion to the "Principles of Statistical Modeling" (PSM) module MDE-CS-03.
- The ML module focuses on practical ML skills, whereas PSM module on rigorous mathematical formalism and analysis.
- For students not familiar with graph theory, it is recommended to take the first semester course MDE-CS-01 Network Theory, which introduces concepts used in this Machine Learning module.

- Geospatial Data and Analysis, Bill Day, Jon Bruner, Aurelia Moser, 2017, O'Reilly Media, Inc. ISBN: 9781491984314

Content and Educational Aims

This lab module provides the necessary hands-on skills and expertise needed to gather, analyse, and model geospatial and /or temporal data. Integration, analysis, management and visualization of large volumes of spatial data from multiple sources at a variety of scales form a part of the assignments and lab work. Students may also have to design, integrate and implement a variety of sensors to gather, process, visualize and analyze environmental, oceanographic or other geo data. Theoretical concepts are demonstrated, and practical training provided using state of-the-art software and hardware. Examples of applications to various fields such as geo-and bio-sciences, data management, habitat management, risk assessment and geo-marketing are discussed and the role of the internet in data mining and Web GIS illustrated.

Intended Learning Outcomes

By the end of this module, students will be able to

1. design, implement and exploit elementary supervised ML methods for classification and regression with expert care given to dimension reduction preprocessing and regularization;
2. understand and practically use PCA and linear regression;
3. understand the core ideas behind feedforward neural networks and the backpropagation algorithm, as the basis for accessing "deep learning" methods.

<tr><td colspan="5">Content and Educational Aims

Over the last decades biology and medicine have become data sciences. It is thus fitting to explore life sciences with computational methods. This course introduces such computational approaches in the life sciences. We go through various levels of cellular organization – from enzyme kinetics to genome-scale metabolic systems, to signal transduction and gene regulation. Modern high-throughput data in biology and medicine are explored. At all times, we explore, how the interplay of computational analysis and mathematical modelling helps us understand the systems at hand.
The course is specifically designed for students from Data Engineering (DE) and Data Science for Society and Business (DSSB). It serves as the entry point to the Bioinformatics track in DE and as a component of the environment and health track in DSSB. Beyond general high school education, no in-depth knowledge about biology is assumed. An introduction to some basic concepts from cell biology, molecular biology and genetics is provided.</td></tr>
<tr><td colspan="5">Intended Learning Outcomes

Upon completion of this module, students will be able to:
1. use computational approaches in the life sciences;
2. analyze metabolic fluxes;
3. recognize and apply models of signal transduction pathways;
4. analyze gene regulatory systems;
5. analyze gene expression patterns</td></tr>

<tr><td colspan="6">Content and Educational Aims

This is a hands-on module on the mathematical and computational modeling of various complex systems, covering diverse fields of the natural and social sciences. The module starts with an introduction to mathematical modeling. The elements of a model are presented and the steps to follow when constructing a model are reviewed, from formulating the question, determining the basic constituents of a model, and qualitatively and quantitatively describing the relevant system to analyzing the equations with various checks and balances. An introduction are provided on Python, the programming language constituting the main computational tool adopted in the module. To put into practice the theory on the basics of modelling and Python programming, a number of classical models in ecology are reviewed, coded, and numerically analyzed. This will build up the skills for developing models that describe different complex systems and the associated processes. In particular, different ial equation models are developed. They describe:

(1) the dynamics of diseases such as HIV, (2) the microbial growth in batch and chemostat cultures, (3) the dynamics of plankton ecosystems in the oceanic mixed layer, and (4) examples of life acting as a regulating force at a planetary scale. In addition, the lecturer introduces Agent-Based Modelling techniques with applications to cultural segregation problems and spatially explicit predator-prey interactions.</td></tr>
<tr><td colspan="6">Intended Learning Outcomes

By the end of this module, students will be able to:
1. independently design and develop models (from the basic conceptual aspects, to the mathematical equations and the numerical code) for tackling problems in the natural and social sciences
2. undertake numerical equilibria and stability analysis, to evaluate model performance, and to identify uncertainties in model results.</td></tr>

<tr><td colspan="6">Content and Educational Aims
In recent years, big data has become a significant topic in supply chain management, as the amount of data generated in supply chain management practices has grown exponentially. Data analytics are techniques that apply data mining, statistical analysis, predictive analytics, and machine learning to uncover hidden patterns, correlations, trends, and other business-valuable information and knowledge from data.
The module focuses on the supply chain management scenarios that generate and consume data intensively and require data analytics to improve the decision-making process through descriptive, predictive, and prescriptive analytics. These include:
• Descriptive statistics on and historical insight into companies' production, financial, operations, sales, customers, etc.
• Forecasting customer behavior, purchasing patterns, production performance, energy consumption, etc.
• Prescriptive analytics for assessing the offer that should be made to a certain customer, to decide on the shipment strategy for each location, to determine the most efficient material flow in a factory, etc.</td></tr>
<tr><td colspan="6">Intended Learning Outcomes
By the end of this module, students will be able to
1. identify scenarios in supply chain management and evaluate the opportunities and challenges of data analytics applications;
2. determine the objective of data analytics in different scenarios and the data sources required to achieve that objective;
3. apply methods and tools to collect and integrate data from different sources in the context of supply chain management;</td></tr>
</table>

4. apply machine learning and statistical analytics methods and tools to uncover hidden patterns, correlations, trends, and knowledge that are useful for improving supply chain management processes;
5. evaluate data analytics results in different scenarios and solve the problems that might occur throughout the entire data analytics process, from data collection to analysis;
6. develop deployment architecture concepts by integrating existing tools/software;
7. develop business model and ecosystem concepts.

<tr><td colspan="5">Content and Educational Aims

This module introduces data engineering students to the field of data management with Python. Data management describes the vast field of methodologies to collect, store, process and provision data. The aim of this module is to focus on a very applied view of these tasks. Since Python has become the de-facto standard in the field, the initial part of the module is concerned with a basic introduction into core concepts of imperative programming in Python. Data structures and fundamental algorithms are discovered in a hands-on fashion. These will also include basic numerical and data analysis tasks based on NumPy/SciPy. One source from which we can collect and in which we can store data are relational databases. The course introduces the Structured Query Language (SQL) to get access to this data source. More recently, data is frequently stored in Data Frames, a data structure provided by Pandas, a Python library. Pandas also provides functionality to carry out data analysis tasks. Provisioning of data analysis outputs will be done by basic2D visualization techniques.</td></tr>
<tr><td colspan="5">Intended Learning Outcomes

By the end of this module, students will be able to

1. explain and apply fundamental concepts of imperative programming using Python
2. understand and use basic data structures
3. summarize and apply fundamental algorithms (e.g. sorting)
4. execute basic data analysis tasks (average, min, max, ...)
5. Understand and implement linear algebra operations using NumPy/SciPy
6. explain fundamentals of relational databases
7. describe and use SQL to create, modify and query data from relational databases</td></tr>
</table>

8. understand and apply DataFrames and data analysis using Pandas
9. visualize simple data by different types of 2D plots using Matplotlib

Content and Educational Aims

This module aims to introduce students to a modern perspective of signal processing, which in the recent years has seen significant changes due to the emergence of new mathematical and algorithmic tools. At the core of this new perspective is the departure from canonical compact orthonormal representations (of which Fourier analysis is the primary example) and minimalistic sampling (of which the Nyquist rate is the primary example) towards sparse, non-orthogonal signal representations, typically resulting from oversampling and the use of redundant bases. Another major aspect in which modern signal processing differs from its classical counterpart is the significantly larger role played by numerical methods. Indeed, traditional signal processing was developed during an era when computers were either non-existent or incipient, thus relying fundamentally on tools such as algebraic geometry and harmonic analysis, and consequently typically leading to techniques that yield exact results and even closed-form solutions under ideal conditions (e.g., in the absence of distortion), which are then brought to practical applications by means of suitable algorithmic approximations. By contrast, modern signal processing embraces numerical methods and 'algorithms' at its core, thus relying heavily on tools such as convex optimization, non-convex optimization (e.g. genetic algorithms) and machine learning which, albeit not necessarily empirical, take full advantage of the computational power of modern computers.

This module explores several of the aforementioned tools, discussing concrete examples such as isotropic embedding (which can be used for wireless localization), matrix completion (which can be used for data compression), and the design of tight frames (which can be used to increase robustness to distortion).

Intended Learning Outcomes

Upon completion of this module, students will be able to

1. understand the fundamental principles behind modern signal processing algorithms;
2. gain a new perspective of signal processing problems through the prism of new algorithms in which signals are treated as data;
3. practice on how to address both new and "old'" signal processing problems via the new tools of modern signal processing.
4. further develop their Matlab programming skills (or an equivalent programming language with sufficient support of for mathematical libraries);

5. gain a deeper and a modern understanding of crucial mathematical tools such as linear algebra (vectors and matrices) and functional analysis (Hilbert spaces, inner products, basic calculus), in the context of their application to data engineering.

Recommendations for Preparation

Read the Syllabus.

Content and Educational Aims

'Network science' employs the formal view of graph theory to understand the design principles of complex systems. Abstracting cellular processes in from biology into networks can contribute to an understanding of how such cellular systems function. Over the last two decades, this approach has revolutionized the way we think about biological systems.

Here, the application of network analysis to biology and medicine are discussed. In this module standard networks considered in Systems Biology (gene regulatory networks, metabolic networks, signaling networks and protein-protein interaction networks), in which each link corresponds to a specific biological process are discussed. It is enhanced by the discussion of relational networks, which are capable of serving as very efficient sources of data integration and interpretation: the diseasome, a network where a disease is linked to a gene, in which there is data evidence relating the gene to the disease; and the drug-target network, where drugs and proteins linked by drug-target associations.
In addition to standard review articles and textbooks on Network Science, material from recent scientific literature is incorporated in the module.

Intended Learning Outcomes

By the end of this module, students will be able to

1. understand the basic principles of network science applications to Biology and Medicine;
2. use and access the main bioinformatics databases to obtain biological networks;
3. analyze biological networks;
4. combine multiple data analysis tools for a comprehensive analysis of molecular data;
5. describe in some detail essential facts and theoretical concepts derived from recent scientific literature;
6. identify open questions from the scientific literature and synthesize information from the literature into a scientific presentation.

☒ None	☒ None	• Analysis, basic Calculus and Linear Algebra	**Duration** 1 semester	**Workload** 125 hours

Recommendations for Preparation

Read the Syllabus.

Content and Educational Aims

This module is a first hands-on introduction to theory and applications of dynamical systems. A crucial component of this class is the use of computer experiments to foster intuitive understanding and develop students' skills in using the computer to bridge the gap between mathematical idea and concrete implementation and application.

Topics include nonlinear oscillators, coupled pendula, and pattern formation in chemical reactions. A main focus of the lab is the development of standard tools for the numerical solution of differential equations, the application of automated tools for bifurcation analysis, and continuation methods. Further topics include agent-based models and pseudo-spectral PDE solvers for reaction-diffusion equations.

Intended Learning Outcomes

Upon completion of this module, students will be able to

1. apply fundamental concepts of deterministic and stochastic modeling;
2. implement standard mathematical software;
3. design, conduct, and interpret controlled in-silico scientific experiments;
4. demonstrate the mastery of numerical methods to solve differential equations.

<tr><td colspan="6">Content and Educational Aims

This module offers a highly structured introduction to the fundamentals of combinatorics and probabilities as they are used for statistical modeling and estimation. It is a gateway for graduate students who have not been exposed to the topics so far, or who were exposed long ago and needs to be refreshed. The module starts with the concept of probabilities, including joint, conditional and total probabilities with a focus on independence, which leads us to a discussion of Bayes's theorem. We shall then proceed to factorials, and binomial coefficients, with many applications to be followed by the binomial law, and its Poisson and Normal approximations. A second block covers random variables with their distributions and density functions. Here we are going to discuss continuous random variables in detail. Block three continues with the essential ideas of expected values, moments, and estimation.</td></tr>
<tr><td colspan="6">Intended Learning Outcomes

Upon completion of this module, students will be able to

1. understand the fundamental concepts of probabilities and combinatorics and to apply them in structured situations,
2. apply important probability laws (Binomial, Poisson, Normal),
3. understand and apply probability distributions and densities,
4. understand and apply means, variances, and covariances – also in the context of simple estimation contexts.</td></tr>

<tr><td colspan="6">Content and Educational Aims

This module aims to provide the student with an in-depth understanding and command of one of the data analytics or data management techniques that are represented by the research groups of the faculty of DE. The subdiscipline involved (e.g. database management, machine learning, statistical data analysis, information theory, data acquisition, or big data technologies) changes from year to year and from hosting group to hosting group. The detailed structure and schedule depend on the specific demands and options of the hosting group.

An Advanced Project module typically begins with an introduction to the concerned technology or method. This leads the student to a level of competence with which he/she can insightfully apply the respective methods to practical, real-life tasks. Typically, the second half of the module is devoted to individual (or if indicated, group) projects in which a nontrivial data management/ analysis task, given by the instructor, is completed. The project outcome is a technical report (target size: 20 pages) together as well as with a presentation to the Data Engineering program students and faculty.</td></tr>
<tr><td colspan="6">Intended Learning Outcomes

Upon completion of this module, students will be able to

1. understand current technical/scientific literature, and distinguish good from second-rate publications
2. write / configure computer programs / tools specifically for the subject area
3. master relevant data pre/ postprocessing routines specifically for the subject area
4. design and schedule a complex DE project, including escape options, keep milestones/timelines
5. consistently apply scientific language to communicate in writing his/her understanding clearly and precisely to a non-expert audience.</td></tr>
<tr><td colspan="6">Indicative Literature

The literature is provided individually to each student by each instructor of the respective advanced project.</td></tr>

<tr><td colspan="6">Content and Educational Aims

The academically rigorous nature of graduate studies requires students to master academic writing skills and techniques. In this introductory course, students in DE master's program will learn the foundations of academic writing at a graduate level, with special focus on writing academic essays, identifying organizational patterns of academic texts, and formulating arguments to produce cohesive and coherent academic papers. Through the process of drafting, continuous feedback and editing, students will improve their writing skills. This course will also help students develop their research skills by highlighting techniques of finding and evaluating sources, and utilizing citation and referencing styles. As graduate students, adhering to The Code of Academic Integrity is a requirement. Hence, this course will incorporate a session on scholarly and intellectual standards set by Constructor University. The second part of this course is a training seminar. It will give answers to frequently asked questions by students on the topics of working and living in Germany. Here the students will find information on employment and how to get access to the German labor market. The seminar also provides an overview of labor conditions in Germany, the multifaceted forms of employment, business cultures and useful tips and information for the job entry in a German company.</td></tr>
<tr><td colspan="6">Intended Learning Outcomes

Upon completion of this module, students will be able to

1. structure their ideas to write clear summaries, coherent paragraphs and cohesive literature reviews;</td></tr>

Recommendations for Preparation

Read the Syllabus

Content and Educational Aims

An executive career in an international business environment requires excellent communication and presentation skills. Managers have to communicate effectively with a large variety of target audiences, often in different languages and with different cultural backgrounds. This is true for employees and/or direct reports, business partners as well as customers. The ability to present and communicate succinctly and confidently while being culturally aware and building rapport and trust with different audiences is crucial. In this interactive module, students are introduced to the basics of effective presentation and communication techniques. They learn how to present themselves, their business project, or academic work, with impact, tailoring both the content and their delivery style to different types of audiences.

Intended Learning Outcomes

Upon completion of the module, students will be able to

1. act as effective communicators – in both group and individual situations;
2. understand interpersonal communication models and group dynamics in presentations;
3. enjoy the process of presenting;
4. understand the importance of building rapport and trust with audiences;
5. use presentation software (PowerPoint, Prezi) confidently and in a visually pleasant way;
6. learn how to structure presentations in a coherent manner and develop captivating narratives;
7. work with different presentation formats (Ignite, Pecha Kucha, Pitching etc.);
8. understand and apply the basics of logical reasoning in oratory (deductive/inductive);
9. develop oratory and rhetorical skills drawing on Aristotle's teaching of logos, ethos and pathos;
10. understand and apply the basics of interpersonal communication (Johari Window, 4-Ears model etc.);
11. give and receive constructive feedback;
12. present themselves in different business situations;
13. collaborate effective in intercultural teams.

Indicative Literature

This course utilizes lecture formats, case studies and interactive
presentations, discussions, role play and peer-to-peer coaching. The course will also use internet resources, videos, and home assignments to illustrate and practice specific communication aspects.

Usability and Relationship to other Modules

This module is recommended to be taken together with the elective modules in the Bio-Informatics track.

Content and Educational Aims

Many data specialists claim that we are at the cusp of an information revolution. Based on inventions dating back to WWII, IT innovations have re-organized our society around one "big metadata computer" that is permanently computing data and associating metadata about everything we do. Digital technologies also have the potential to disrupt the ethical standards and rules of our society. In this module, we discuss whether we have to forfeit privacy in times of big data, if machines compromise our identity, and if shared data enables institutions to abuse their power and undermine the civil society?

The module pursues three goals. 1. Participants will immerse themselves and learn about core ethical theories. 2. They will integrate this theoretical knowledge and develop a "Big Data Ethics," which they 3. will put into practice. For the second and third purposes, in-classroom discussions and interactions are indispensable for identifying possible dilemmas and conflict of interests and for balancing contradictions to derive practical solutions and policy advice.

Intended Learning Outcomes

By the end of the module, students will be able to

1. report on major ethical theories relevant to digital technologies
2. integrate different ethical standpoints and arguments to address concrete societal problems
3. assess the societal and ethical implications of digitization
4. deal with legal aspects of ethics by applying means to prevent and deal with violations of privacy and transparency
5. apply actions to contribute to the transition to a more just and trustworthy digital transformation as a part of one's job
6. implement justice and social equality as dimensions of ethics and sustainability

Indicative Literature

Usability and Relationship to other Modules

It is one of the three Career modules (IT Law, Language III, and Ethics and the Information Revolution) that can be chosen for replacement by the internship. Students need to replace 10 CP for the internship.

Examination Type: Module Examination

Assessment Type: Term Paper — Length: 20 pages
Weight: 100%

Scope: All intended learning outcomes of the module.
Completion: to pass this module, the examination has to be passed with at least 45%.

3.7 Master Thesis (30 CP)

Module Name	**Module Code**	**Level (type)**	**CP**
Master Thesis	MDE-THE-01	Year 2	30

Module Components

Number	Name	Type	CP
MDE-THE-01	Master Thesis	N.A.	30

Module Coordinator	**Program Affiliation**	**Mandatory Status**
Prof. Dr. Stefan Kettemann	• MSc Data Engineering (DE)	Mandatory for DE

Entry Requirements

Pre-requisites	Co-requisites	Knowledge, Abilities, or Skills
• MDE-DIS-02 Advanced Project I • MDE-DIS-03 Advanced Project II	☒ None	• Proficiency in the area of the chosen thesis topic.

Frequency	**Forms of Learning and Teaching**
Annually (Spring)	• Private Study (750 hours)
Duration	**Workload**
1 semester	750 hours

Recommendations for Preparation

Read the Syllabus.

Content and Educational Aims

The aim of this module is to train students to motivate, design, carry out and document a research project in one of the areas represented by the research groups of the faculty of DE. Some familiarity with the requisite data engineering techniques will typically have been acquired in one of the preceding Advanced Projects (MDE-DIS-02 or MDE-DIS-03). The thesis topic is determined in mutual agreement with the module instructor. They may arise from the ongoing research in the instructor's own research group, but it is also possible for a student to adopt a topic of his/her own choice provided the instructor agrees to supervise it. The thesis work comprises the full cycle of a scientific research endeavor: (i) identifying a relevant open research question, (ii) carrying out a literature survey to put the planned work in its context and relate it to the state of the art (SoA), (iii) formulate a concrete research objective, (iv) design a research plan including a statement of criteria to evaluate the success of the project, (v) carry out the plan (with the possibility to change the original plan when motivated), (vi) document the results, (vii) analyze the results with respect to the SoA, the original objective, and the success criteria, and (viii) document all of this in a thesis report. All of this work should be done with as much self-guidance as can be reasonably expected. The instructor will likely give substantial guidance for (i) and (iii), whereas the other aspects will be addressed with larger degrees of self-guidance. A research proposal document summarizing (i) – (iv) is expected as an interim result and milestone (target size: 10 pages). In the first weeks of the course, an intense taught tutorial on scientific working and writing is held. The subsequent weeks follow a seminar style where students present and discuss literature as well as their own results to date. The project consists of the proposal, a thesis report (target size: 30–60 pages, and an oral presentation at the end of the course.

Intended Learning Outcomes

Discipline-Specific Skills (subject area depending on research discipline of the hosting group)

1. understanding, at a professional level, of a circumscribed segment of the hosting group's research area;
2. ability to apply specific and selected DE techniques, as required for the project, at a professional level;
3. general professional skills;
4. designing and carrying out the full cycle of a scientific research project in a professional manner;
5. formulating a research proposal such that that it could serve as a funding proposal;

6. writing a research thesis such that it could be submitted to a scientific publication venue, or as a project report to a funding agency or industrial client;
7. presentation of project results for specialists and non-specialists.

Indicative Literature

N.A.

Usability and Relationship to other Modules

The master thesis can build on the advanced project courses MDE-DIS-02 Advanced Project 1 and MDE-DIS-03 Advanced Project 2 but the students are free to choose a different topic and a different supervisor for the master thesis.

Examination Type: Module Examination

Assessment Component 1: Thesis — Length: 30 – 60 pages, Weight: 75%

Scope: All intended learning outcomes of this module.

Assessment Component 2: Oral Examination (Defense) — Duration: 20 minutes, Weight: 25%

Scope: Mainly presentation of project results but the presentation touches all intended learning outcomes

Completion: This module is passed with an assessment-component weighted average grade of 45% or higher.

4 Data Engineering Graduate Program Regulations

4.1 Scope of These Regulations

The regulations in this handbook are valid for all students who entered the Data Engineering graduate program at Constructor University in Fall 2024. In case of conflict between the regulations in this handbook and the general Policies for Master Studies, the latter apply (see https://constructor.university/student-life/student-services/university-policies/academic-policies

In exceptional cases, certain necessary deviations from the regulations of this study handbook might occur during the course of study (e.g., change of the semester sequence, assessment type, or the teaching mode of courses).

In general, Constructor University Bremen reserves therefore the right to change or modify the regulations of the program handbook also after its publication at any time and in its sole discretion.

4.2 Degree

Upon successful completion of the program, students are awarded a Master of Science (M.Sc.) degree in Data Engineering.

4.3 Graduation Requirements

In order to graduate, students need to obtain 120 CP. In addition, the following graduation requirements apply:

- In each module, students need to obtain a minimum amount of CP as indicated in chapter 2 of this handbook.
- Students need to complete all mandatory components of the program as indicated in chapter 2 of this handbook.
